Keywords: Arbitrary Precision, High Accuracy, Multiple Precision Floating-Point, Rmpfr

The R package **Rmpfr** allows to use arbitrarily precise numbers instead of R’s double precision numbers in many R computations and functions.

This is achieved by defining S4 classes of such numbers and vectors, matrices, and arrays thereof, where all arithmetic and mathematical functions work via the (GNU) MPFR C library, where MPFR is acronym for “*Multiple Precision Floating-Point Reliably*”. MPFR is Free Software, available under the LGPL license, and itself is built on the free GNU Multiple Precision arithmetic library (GMP).

Consequently, by using **Rmpfr**, you can often call your R function or numerical code with mpfr–numbers instead of simple numbers, and all results will automatically be much more accurate.

```
> options(digits = 17) # to print to full "standard R" precision
> .N <- function(.) mpfr(., precBits = 200)
> exp( 1 )

[1] 2.7182818284590451

> exp(.N(1))

1 'mpfr' number of precision 200 bits
[1] 2.7182818284590452353602874713526624977572470936999595749669679
```

Applications by the package author include testing of Bessel or polylog functions and distribution computations, e.g. for stable distributions. In addition, the **Rmpfr** has been used on the R–help or R–devel mailing list for high-accuracy computations, e.g., in comparison with results from commercial software such as Maple, and in private communications with Petr Savicky about fixing R bug [PR#14491](#).

We expect the package to be used in more situations for easy comparison studies about the accuracy of algorithms implemented in R, both for “standard R” and extension packages.
