Package 'fasstr'

November 7, 2020

Title Analyze, Summarize, and Visualize Daily Streamflow Data

Version 0.3.2

Description The Flow Analysis Summary Statistics Tool for R, 'fasstr', provides various
functions to tidy and screen daily stream discharge data; calculate and visualize various summary statistics
and metrics; and compute annual trending (using 'zyp' package methods <https://CRAN.R-project.org/package=zyp>)
and volume frequency analyses (using methods similar to HEC-SSP (2019)
<https://www.hec.usace.army.mil/software/hec-ssp/>). It features useful function arguments for filtering of and
handling dates, customizing data and metrics, and the ability to pull daily data directly from the Water Survey
of Canada hydrometric database (<https://collaboration.cmc.ec.gc.ca/cmc/hydrometrics/www/>).

add_basin_area *Add a basin area column to daily flows*

Description

Add a column of basin areas to a daily streamflow data set, in units of square kilometres.

Usage

```
add_basin_area(data, groups = STATION_NUMBER, station_number, basin_area)
```

Arguments

data
: Data frame of daily data that contains columns of dates, flow values, and (optional) groups (e.g. station numbers). Leave blank if using station_number argument.

groups
: Name of column in data that contains unique identifiers for different data sets, if applicable. Only required if groups column name is not 'STATION_NUMBER'. Function will automatically group by a column named 'STATION_NUMBER' if present. Remove the 'STATION_NUMBER' column beforehand to remove this grouping. Leave blank if using station_number argument.

station_number
: Character string vector of seven digit Water Survey of Canada station numbers (e.g. "08NM116") of which to extract daily streamflow data from a HYDAT database. Requires tidyhydat package and a HYDAT database. Leave blank if using data argument.

basin_area   Upstream drainage basin area, in square kilometres, to apply to observations. Three options:

(1) Leave blank if groups is STATION_NUMBER with HYDAT station numbers to extract basin areas from HYDAT.

(2) A single numeric value to apply to all observations.

(3) List each basin area for each group/station in groups (can override HYDAT value if listed) as such c("08NM116" = 795,"08NM242" = 10). If group is not listed the HYDAT area will be applied if it exists, otherwise it will be NA.

Value

A tibble data frame of the original source data with an additional column:

Basin_Area_sqkm

area of upstream drainage basin area, in square kilometres

Examples

```
# Run if HYDAT database has been downloaded (using tidyhydat::download_hydat())
if (file.exists(tidyhydat::hy_downloaded_db())) {

# Add the HYDAT basin area to a data frame with station numbers
flow_data <- tidyhydat::hy_daily_flows(station_number = "08NM116")
add_basin_area(data = flow_data)

# Add the HYDAT basin area to data from HYDAT
add_basin_area(station_number = "08NM116")

# Set a custom basin area
add_basin_area(station_number = "08NM116",
               basin_area = 800)

# Set multiple custom basin areas for multiple stations
add_basin_area(station_number = c("08NM116", "08NM242"),
               basin_area = c("08NM116" = 800, "08NM242" = 10))

}
```

---

add_cumulative_volume   *Add a daily cumulative volumetric flows column to daily flows*

Description

Add a column of rolling daily cumulative volumetric flows on an annual basis to a daily streamflow data set. Adds the volumetric discharge from each day with the previous day(s) for each year, in units of cubic metres. The cumulative flows restart every year and are only calculated in years with complete data.

Usage

```
add_cumulative_volume(
  data,
  dates = Date,
  values = Value,
  groups = STATION_NUMBER,
  station_number,
  water_year_start = 1
)
```

Arguments

data	Data frame of daily data that contains columns of dates, flow values, and (optional) groups (e.g. station numbers). Leave blank if using `station_number` argument.
dates	Name of column in `data` that contains dates formatted YYYY-MM-DD. Only required if dates column name is not 'Date' (default). Leave blank if using `station_number` argument.
values	Name of column in `data` that contains numeric flow values, in units of cubic metres per second. Only required if values column name is not 'Value' (default). Leave blank if using `station_number` argument.
groups	Name of column in `data` that contains unique identifiers for different data sets, if applicable. Only required if groups column name is not 'STATION_NUMBER'. Function will automatically group by a column named 'STATION_NUMBER' if present. Remove the 'STATION_NUMBER' column beforehand to remove this grouping. Leave blank if using `station_number` argument.
station_number	Character string vector of seven digit Water Survey of Canada station numbers (e.g. `"08NM116"`) of which to extract daily streamflow data from a HYDAT database. Requires `tidyhydat` package and a HYDAT database. Leave blank if using `data` argument.
water_year_start	
	Numeric value indicating the month (1 through 12) of the start of water year for analysis. Default 1.

Value

A tibble data frame of the source data with an additional column:

Cumul_Volume_m3

cumulative volumetric flows for each day for each year, in units of cubic metres

Examples

```
# Run if HYDAT database has been downloaded (using tidyhydat::download_hydat())
if (file.exists(tidyhydat::hy_downloaded_db())) {

# Add a column based on water years starting in August
add_cumulative_volume(station_number = "08NM116",
```

```
                                water_year_start = 8)

  }
```

---

add_cumulative_yield   *Add a daily cumulative water yield column to daily flows*

Description

Add a column of rolling daily cumulative water yields on an annual basis to a daily streamflow data set. Adds the water yields from each day with the previous day(s) for each year, in units of millimetres. Converts cumulative discharge to a depth of water based on the upstream drainage basin area from `basin_area` argument. The cumulative flows restart every year and are only calculated in years with complete data.

Usage

```
add_cumulative_yield(
  data,
  dates = Date,
  values = Value,
  groups = STATION_NUMBER,
  station_number,
  basin_area,
  water_year_start = 1
)
```

Arguments

data	Data frame of daily data that contains columns of dates, flow values, and (optional) groups (e.g. station numbers). Leave blank if using `station_number` argument.
dates	Name of column in `data` that contains dates formatted YYYY-MM-DD. Only required if dates column name is not 'Date' (default). Leave blank if using `station_number` argument.
values	Name of column in `data` that contains numeric flow values, in units of cubic metres per second. Only required if values column name is not 'Value' (default). Leave blank if using `station_number` argument.
groups	Name of column in `data` that contains unique identifiers for different data sets, if applicable. Only required if groups column name is not 'STATION_NUMBER'. Function will automatically group by a column named 'STATION_NUMBER' if present. Remove the 'STATION_NUMBER' column beforehand to remove this grouping. Leave blank if using `station_number` argument.
station_number	Character string vector of seven digit Water Survey of Canada station numbers (e.g. `"08NM116"`) of which to extract daily streamflow data from a HYDAT database. Requires `tidyhydat` package and a HYDAT database. Leave blank if using `data` argument.

basin_area
Upstream drainage basin area, in square kilometres, to apply to observations. Three options:

(1) Leave blank if groups is STATION_NUMBER with HYDAT station numbers to extract basin areas from HYDAT.

(2) A single numeric value to apply to all observations.

(3) List each basin area for each group/station in groups (can override HYDAT value if listed) as such c("08NM116" = 795,"08NM242" = 10). If group is not listed the HYDAT area will be applied if it exists, otherwise it will be NA.

water_year_start
Numeric value indicating the month (1 through 12) of the start of water year for analysis. Default 1.

Value

A tibble data frame of the source data with an additional column:

Cumul_Yield_mm cumulative yield flows for each day for each year, in units of millimetres

Examples

```
# Run if HYDAT database has been downloaded (using tidyhydat::download_hydat())
if (file.exists(tidyhydat::hy_downloaded_db())) {

# Add a column based on water years starting in August
add_cumulative_yield(station_number = "08NM116",
                     water_year_start = 8)

# Add a column based on water years starting in August with a custom basin area to calculate yield
add_cumulative_yield(station_number = "08NM116",
                     water_year_start = 8,
                     basin_area = 800)

}
```

---

add_daily_volume   *Add a daily volumetric flows column to daily flows*

Description

Add a column of daily volumetric flows to a daily streamflow data set, in units of cubic metres. Converts the discharge to a volume.

Usage

```
add_daily_volume(data, values = Value, station_number)
```

Arguments

`data`	Data frame of daily data that contains columns of dates, flow values, and (optional) groups (e.g. station numbers). Leave blank if using `station_number` argument.
`values`	Name of column in `data` that contains numeric flow values, in units of cubic metres per second. Only required if values column name is not 'Value' (default). Leave blank if using `station_number` argument.
`station_number`	Character string vector of seven digit Water Survey of Canada station numbers (e.g. `"08NM116"`) of which to extract daily streamflow data from a HYDAT database. Requires `tidyhydat` package and a HYDAT database. Leave blank if using `data` argument.

Value

A tibble data frame of the source data with an additional column:

`Volume_m3`	daily total volumetric flow, in units of cubic metres

Examples

```
# Run if HYDAT database has been downloaded (using tidyhydat::download_hydat())
if (file.exists(tidyhydat::hy_downloaded_db())) {

# Add a column of daily flow volumes
add_daily_volume(station_number = "08NM116")

}
```

`add_daily_yield`	*Add a daily volumetric water yield column to daily flows*

Description

Add a column of daily water yields to a daily streamflow data set, in units of millimetres. Converts the discharge to a depth of water based on the upstream drainage basin area.

Usage

```
add_daily_yield(
  data,
  values = Value,
  groups = STATION_NUMBER,
  station_number,
  basin_area
)
```

Arguments

`data`	Data frame of daily data that contains columns of dates, flow values, and (optional) groups (e.g. station numbers). Leave blank if using `station_number` argument.
`values`	Name of column in `data` that contains numeric flow values, in units of cubic metres per second. Only required if values column name is not 'Value' (default). Leave blank if using `station_number` argument.
`groups`	Name of column in `data` that contains unique identifiers for different data sets, if applicable. Only required if groups column name is not 'STATION_NUMBER'. Function will automatically group by a column named 'STATION_NUMBER' if present. Remove the 'STATION_NUMBER' column beforehand to remove this grouping. Leave blank if using `station_number` argument.
`station_number`	Character string vector of seven digit Water Survey of Canada station numbers (e.g. `"08NM116"`) of which to extract daily streamflow data from a HYDAT database. Requires `tidyhydat` package and a HYDAT database. Leave blank if using `data` argument.
`basin_area`	Upstream drainage basin area, in square kilometres, to apply to observations. Three options:
	(1) Leave blank if `groups` is STATION_NUMBER with HYDAT station numbers to extract basin areas from HYDAT.
	(2) A single numeric value to apply to all observations.
	(3) List each basin area for each group/station in groups (can override HYDAT value if listed) as such `c("08NM116" = 795,"08NM242" = 10)`. If group is not listed the HYDAT area will be applied if it exists, otherwise it will be NA.

Value

A tibble data frame of the source data with an additional column:

`Yield_mm`	daily water yield, in units of millimetres

Examples

```
# Run if HYDAT database has been downloaded (using tidyhydat::download_hydat())
if (file.exists(tidyhydat::hy_downloaded_db())) {

# Add a column of yields based on HYDAT basin area
add_daily_yield(station_number = "08NM116")

# Add a column of yields based on a custom basin area
add_daily_yield(station_number = "08NM116",
                basin_area = 800)

}
```

---

add_date_variables *Add year, month, and day of year variable columns to daily flows*

Description

Add columns of CalendarYear (YYYY), Month (MM), MonthName (e.g. 'Jan'), WaterYear (YYYY), and DayofYear (1-365 or 366; of WaterYear); to a data frame with a column of dates called 'Date'. Water years are designated by the year in which they end. For example, Water Year 1999 (starting Oct) is from 1 Oct 1998 (DayofYear 1) to 30 Sep 1999 (DayofYear 365)).

Usage

```
add_date_variables(data, dates = Date, station_number, water_year_start = 1)
```

Arguments

data	Data frame of daily data that contains columns of dates, flow values, and (optional) groups (e.g. station numbers). Leave blank if using `station_number` argument.
dates	Name of column in data that contains dates formatted YYYY-MM-DD. Only required if dates column name is not 'Date' (default). Leave blank if using `station_number` argument.
station_number	Character string vector of seven digit Water Survey of Canada station numbers (e.g. `"08NM116"`) of which to extract daily streamflow data from a HYDAT database. Requires `tidyhydat` package and a HYDAT database. Leave blank if using `data` argument.
water_year_start	Numeric value indicating the month (1 through 12) of the start of water year for analysis. Default 1.

Value

A tibble data frame of the source data with additional columns:

CalendarYear	calendar year
Month	numeric month (1 to 12)
MonthName	month abbreviation (Jan-Dec)
WaterYear	year starting from the selected month start, water_year_start
DayofYear	day of the year from the selected month start (1-365 or 366)

Examples

```
# Run if HYDAT database has been downloaded (using tidyhydat::download_hydat())
if (file.exists(tidyhydat::hy_downloaded_db())) {

# Add date variables using calendar years
```

```
add_date_variables(station_number = "08NM116")

# Add date variables using water years starting in August
add_date_variables(station_number = "08NM116",
                   water_year_start = 8)

}
```

---

add_rolling_means   *Add rolling n-day average column(s) to daily flows*

Description

Adds selected n-day rolling means to a daily streamflow data set. Based on selected n-days and alignment, the rolling mean for a given day is obtained by averaging the adjacent dates of daily mean values. For example, rolling days of `'7'` and `'right'` alignment would obtain a mean of the given and previous 6 days of daily mean flow.

Usage

```
add_rolling_means(
  data,
  dates = Date,
  values = Value,
  groups = STATION_NUMBER,
  station_number,
  roll_days = c(3, 7, 30),
  roll_align = "right"
)
```

Arguments

data	Data frame of daily data that contains columns of dates, flow values, and (optional) groups (e.g. station numbers). Leave blank if using `station_number` argument.
dates	Name of column in `data` that contains dates formatted YYYY-MM-DD. Only required if dates column name is not 'Date' (default). Leave blank if using `station_number` argument.
values	Name of column in `data` that contains numeric flow values, in units of cubic metres per second. Only required if values column name is not 'Value' (default). Leave blank if using `station_number` argument.
groups	Name of column in `data` that contains unique identifiers for different data sets, if applicable. Only required if groups column name is not 'STATION_NUMBER'. Function will automatically group by a column named 'STATION_NUMBER' if present. Remove the 'STATION_NUMBER' column beforehand to remove this grouping. Leave blank if using `station_number` argument.

station_number   Character string vector of seven digit Water Survey of Canada station numbers
                 (e.g. "08NM116") of which to extract daily streamflow data from a HYDAT
                 database. Requires `tidyhydat` package and a HYDAT database. Leave blank if
                 using `data` argument.

roll_days   Numeric values of the number of days to apply a rolling mean. Default `c(3,7,30)`.

roll_align   Character string identifying the direction of the rolling mean from the specified
                 date, either by the first (`'left'`), last (`'right'`), or middle (`'center'`) day of
                 the rolling n-day group of observations. Default `'right'`.

Value

A data frame of the source data with an additional column(s):

QnDay   rolling means of the n-day flow values of the designated date and adjacent dates,
                 direction of mean specified by roll_align

Default additional columns:

Q3Day   rolling means of the 3-day flow values of the designated date and previous 2
                 days (roll_align = "right")

Q7Day   rolling means of the 7-day flow values of the designated date and previous 6
                 days (roll_align = "right")

Q30Day   rolling means of the 30-day flow values of the designated date and previous 29
                 days (roll_align = "right")

Examples

```
# Run if HYDAT database has been downloaded (using tidyhydat::download_hydat())
if (file.exists(tidyhydat::hy_downloaded_db())) {

# Add default 3, 7, and 30-day rolling mean columns, with "right" alignment
add_rolling_means(station_number = "08NM116")

# Add custom 5 and 10-day rolling mean columns
add_rolling_means(station_number = "08NM116",
                  roll_days = c(5,10))

# Add default 3, 7, and 30-day rolling mean columns, with "left" alignment
add_rolling_means(station_number = "08NM116",
                  roll_align = "left")

}
```

---

add_seasons   *Add a column of seasons*

Description

Adds a column of seasons identifiers to a data frame with a column of dates called 'Date'. The length of seasons, in months, is provided using the `seasons_length` argument. As seasons are grouped by months the length of the seasons must be divisible into 12 with one of the following season lengths: 1, 2, 3, 4, 6, or 12 months. The start of the first season coincides with the start month of each year; 'Jan-Jun' for 6-month seasons starting with calendar years or 'Dec-Feb' for 3-month seasons starting with water year starting in December.

Usage

```
add_seasons(
  data,
  dates = Date,
  station_number,
  water_year_start = 1,
  seasons_length
)
```

Arguments

data	Data frame of daily data that contains columns of dates, flow values, and (optional) groups (e.g. station numbers). Leave blank if using `station_number` argument.
dates	Name of column in `data` that contains dates formatted YYYY-MM-DD. Only required if dates column name is not 'Date' (default). Leave blank if using `station_number` argument.
station_number	Character string vector of seven digit Water Survey of Canada station numbers (e.g. `"08NM116"`) of which to extract daily streamflow data from a HYDAT database. Requires `tidyhydat` package and a HYDAT database. Leave blank if using `data` argument.
water_year_start	Numeric value indicating the month (1 through 12) of the start of water year for analysis. Default 1.
seasons_length	Numeric value indicating the desired length of seasons in months, divisible into 12. Required.

Value

A tibble data frame of the source data with additional column:

Season	season identifier labelled by the start and end month of the season

Examples

```
# Run if HYDAT database has been downloaded (using tidyhydat::download_hydat())
if (file.exists(tidyhydat::hy_downloaded_db())) {

# Add a column with four annual seasons starting in January
add_seasons(station_number = "08NM116",
            seasons_length = 4)

# Add a column with two annual seasons (of 6 months length) starting in October
add_seasons(station_number = "08NM116",
            water_year_start = 10,
            seasons_length = 6)

}
```

---

  calc_all_annual_stats   *Calculate all fasstr annual statistics*

Description

Calculates annual statistics from all annual `fasstr` functions from a daily streamflow data set. Data is ideally long-term and continuous with minimal missing/seasonal data as annual statistics are calculated. Calculates statistics from all values, unless specified. Returns a tibble with statistics. Data calculated using the following functions:

- `calc_annual_stats()`
- `calc_annual_lowflows()`
- `calc_annual_cumulative_stats()`
- `calc_annual_flow_timing()`
- `calc_annual_outside_normal()`
- `calc_monthly_stats()`

Usage

```
calc_all_annual_stats(
  data,
  dates = Date,
  values = Value,
  groups = STATION_NUMBER,
  station_number,
  basin_area,
  water_year_start = 1,
  start_year,
  end_year,
  exclude_years,
  annual_percentiles = c(10, 90),
```

```
        monthly_percentiles = c(10, 20),
        stats_days = 1,
        stats_align = "right",
        lowflow_days = c(1, 3, 7, 30),
        lowflow_align = "right",
        timing_percent = c(25, 33, 50, 75),
        normal_percentiles = c(25, 75),
        transpose = FALSE,
        ignore_missing = FALSE
)
```

Arguments

data	Data frame of daily data that contains columns of dates, flow values, and (optional) groups (e.g. station numbers). Leave blank if using station_number argument.
dates	Name of column in data that contains dates formatted YYYY-MM-DD. Only required if dates column name is not 'Date' (default). Leave blank if using station_number argument.
values	Name of column in data that contains numeric flow values, in units of cubic metres per second. Only required if values column name is not 'Value' (default). Leave blank if using station_number argument.
groups	Name of column in data that contains unique identifiers for different data sets, if applicable. Only required if groups column name is not 'STATION_NUMBER'. Function will automatically group by a column named 'STATION_NUMBER' if present. Remove the 'STATION_NUMBER' column beforehand to remove this grouping. Leave blank if using station_number argument.
station_number	Character string vector of seven digit Water Survey of Canada station numbers (e.g. "08NM116") of which to extract daily streamflow data from a HYDAT database. Requires tidyhydat package and a HYDAT database. Leave blank if using data argument.
basin_area	Upstream drainage basin area, in square kilometres, to apply to observations. Three options:
	(1) Leave blank if groups is STATION_NUMBER with HYDAT station numbers to extract basin areas from HYDAT.
	(2) A single numeric value to apply to all observations.
	(3) List each basin area for each group/station in groups (can override HYDAT value if listed) as such c("08NM116" = 795, "08NM242" = 10). If group is not listed the HYDAT area will be applied if it exists, otherwise it will be NA.
water_year_start	
	Numeric value indicating the month (1 through 12) of the start of water year for analysis. Default 1.
start_year	Numeric value of the first year to consider for analysis. Leave blank to use the first year of the source data.
end_year	Numeric value of the last year to consider for analysis. Leave blank to use the last year of the source data.

exclude_years   Numeric vector of years to exclude from analysis. Leave blank to include all years.

annual_percentiles
                 Numeric vector of percentiles to calculate annually. Set to NA if none required. Used for calc_annual_stats() function. Default c(10,90).

monthly_percentiles
                 Numeric vector of percentiles to calculate monthly for each year. Set to NA if none required. Used for calc_monthly_stats() function. Default c(10,20).

stats_days   Numeric vector of the number of days to apply a rolling mean on basic stats. Default c(1). Used for calc_annual_stats() and calc_monthly_stats() functions.

stats_align   Character string identifying the direction of the rolling mean on basic stats from the specified date, either by the first ('left'), last ('right'), or middle ('center') day of the rolling n-day group of observations. Default 'right'. Used for calc_annual_stats(), calc_monthly_stats(), and calc_annual_outside_normal() functions.

lowflow_days   Numeric vector of the number of days to apply a rolling mean on low flow stats. Default c(1,3,7,30). Used for calc_lowflow_stats() function.

lowflow_align   Character string identifying the direction of the rolling mean on low flow stats from the specified date, either by the first ('left'), last ('right'), or middle ('center') day of the rolling n-day group of observations. Default 'right'. Used for calc_lowflow_stats() function.

timing_percent   Numeric vector of percents of annual total flows to determine dates. Used for calc_annual_flow_timing() function. Default c(25,33.3,50,75).

normal_percentiles
                 Numeric vector of two values, lower and upper percentiles, respectively indicating the limits of the normal range. Default c(25,75).

transpose   Logical value indicating whether to transpose rows and columns of results. Default FALSE.

ignore_missing   Logical value indicating whether dates with missing values should be included in the calculation. If TRUE then a statistic will be calculated regardless of missing dates. If FALSE then only those statistics from time periods with no missing dates will be returned. Default FALSE.

Value

A tibble data frame with column "Year" and then 107 (default) variables from the fasstr annual functions. See listed functions above for default variables. Transposing data creates a column of "Statistics" and subsequent columns for each year selected.

---

calc_annual_cumulative_stats

Calculate annual (and seasonal) cumulative flows

Description

Calculates annual and seasonal total flows, as volumetric discharge or water yields, from a daily
streamflow data set. For water year and seasonal data, the year is identified by the year in which the
year or season ends. Two-seasons and four-seasons per year are calculated, with each 6 and 3-month
seasons starting with the first month of the year (Jan for calendar year, specified for water year).
Each season is designated by the calendar or water year in which it occurs. Calculates statistics
from all values from complete years, unless specified. Returns a tibble with statistics.

Usage

```
calc_annual_cumulative_stats(
  data,
  dates = Date,
  values = Value,
  groups = STATION_NUMBER,
  station_number,
```

```
  use_yield = FALSE,
  basin_area,
  water_year_start = 1,
  start_year,
  end_year,
  exclude_years,
  months = 1:12,
  include_seasons = FALSE,
  transpose = FALSE
)
```

Arguments

data	Data frame of daily data that contains columns of dates, flow values, and (optional) groups (e.g. station numbers). Leave blank if using `station_number` argument.
dates	Name of column in `data` that contains dates formatted YYYY-MM-DD. Only required if dates column name is not 'Date' (default). Leave blank if using `station_number` argument.
values	Name of column in `data` that contains numeric flow values, in units of cubic metres per second. Only required if values column name is not 'Value' (default). Leave blank if using `station_number` argument.
groups	Name of column in `data` that contains unique identifiers for different data sets, if applicable. Only required if groups column name is not 'STATION_NUMBER'. Function will automatically group by a column named 'STATION_NUMBER' if present. Remove the 'STATION_NUMBER' column beforehand to remove this grouping. Leave blank if using `station_number` argument.
station_number	Character string vector of seven digit Water Survey of Canada station numbers (e.g. `"08NM116"`) of which to extract daily streamflow data from a HYDAT database. Requires `tidyhydat` package and a HYDAT database. Leave blank if using `data` argument.
use_yield	Logical value indicating whether to calculate area-based water yield, in mm, instead of volumetric discharge. Default `FALSE`.
basin_area	Upstream drainage basin area, in square kilometres, to apply to observations. Three options: (1) Leave blank if groups is STATION_NUMBER with HYDAT station numbers to extract basin areas from HYDAT. (2) A single numeric value to apply to all observations. (3) List each basin area for each group/station in groups (can override HYDAT value if listed) as such `c("08NM116" = 795,"08NM242" = 10)`. If group is not listed the HYDAT area will be applied if it exists, otherwise it will be NA.
water_year_start	Numeric value indicating the month (1 through 12) of the start of water year for analysis. Default 1.
start_year	Numeric value of the first year to consider for analysis. Leave blank to use the first year of the source data.

end_year	Numeric value of the last year to consider for analysis. Leave blank to use the last year of the source data.
exclude_years	Numeric vector of years to exclude from analysis. Leave blank to include all years.
months	Numeric vector of months to include in analysis (e.g. `6:8` for Jun-Aug). Leave blank to summarize all months (default `1:12`).
include_seasons	
	Logical value indication whether to include seasonal yields or volumetric discharges. Default `TRUE`.
transpose	Logical value indicating whether to transpose rows and columns of results. Default `FALSE`.

Value

A tibble data frame with the following columns, ending with '_Volume_m3' or '_Yield_mm' based on selection:

Year	calendar or water year selected
Total_*	annual (or selected months) total flow, in m3 or mm

Default seasonal columns:

MMM-MMM_*	first of two season total flows, in m3 or mm
MMM-MMM_*	second of two season total flows, in m3 or mm
MMM-MMM_*	first of four season total flows, in m3 or mm
MMM-MMM_*	second of four season total flows, in m3 or mm
MMM-MMM_*	third of four season total flows, in m3 or mm
MMM-MMM_*	fourth of four season total flows, in m3 or mm

Transposing data creates a column of 'Statistics' and subsequent columns for each year selected.

Examples

```
# Run if HYDAT database has been downloaded (using tidyhydat::download_hydat())
if (file.exists(tidyhydat::hy_downloaded_db())) {

# Calculate annual total volumetric flow statistics
calc_annual_cumulative_stats(station_number = "08NM116")

# Calculate annual total yield statistics with default HYDAT basin area
calc_annual_cumulative_stats(station_number = "08NM116",
                             use_yield = TRUE)

# Calculate annual total yield statistics with a custom basin area
calc_annual_cumulative_stats(station_number = "08NM116",
                             use_yield = TRUE,
                             basin_area = 800)

}
```

---

calc_annual_flow_timing
Calculate annual timing of flows

Description

Calculates the timing (day of year and date) of portions of total annual flow of daily flow values from a daily streamflow data set. Calculates statistics from all values from complete years, unless specified. Returns a tibble with statistics.

Usage

```
calc_annual_flow_timing(
  data,
  dates = Date,
  values = Value,
  groups = STATION_NUMBER,
  station_number,
  percent_total = c(25, 33.3, 50, 75),
  water_year_start = 1,
  start_year,
  end_year,
  exclude_years,
  transpose = FALSE
)
```

Arguments

data	Data frame of daily data that contains columns of dates, flow values, and (optional) groups (e.g. station numbers). Leave blank if using `station_number` argument.
dates	Name of column in `data` that contains dates formatted YYYY-MM-DD. Only required if dates column name is not 'Date' (default). Leave blank if using `station_number` argument.
values	Name of column in `data` that contains numeric flow values, in units of cubic metres per second. Only required if values column name is not 'Value' (default). Leave blank if using `station_number` argument.
groups	Name of column in `data` that contains unique identifiers for different data sets, if applicable. Only required if groups column name is not 'STATION_NUMBER'. Function will automatically group by a column named 'STATION_NUMBER' if present. Remove the 'STATION_NUMBER' column beforehand to remove this grouping. Leave blank if using `station_number` argument.
station_number	Character string vector of seven digit Water Survey of Canada station numbers (e.g. `"08NM116"`) of which to extract daily streamflow data from a HYDAT database. Requires `tidyhydat` package and a HYDAT database. Leave blank if using `data` argument.

percent_total   Numeric vector of percents of total annual flows to determine dates. Default
                 `c(25,33.3,50,75)`.

water_year_start

                 Numeric value indicating the month (1 through 12) of the start of water year for
                 analysis. Default 1.

start_year   Numeric value of the first year to consider for analysis. Leave blank to use the
                 first year of the source data.

end_year   Numeric value of the last year to consider for analysis. Leave blank to use the
                 last year of the source data.

exclude_years   Numeric vector of years to exclude from analysis. Leave blank to include all
                 years.

transpose   Logical value indicating whether to transpose rows and columns of results. De-
                 fault `FALSE`.

Value

A tibble data frame with the following columns:

Year   calendar or water year selected

DoY_'n'pct_TotalQ

                     day of year for each n-percent of total volumetric discharge

Date_'n'pct_TotalQ

                     date (YYYY-MM-DD) for each n-percent of total volumetric discharge

Default columns:

DoY_25pct_TotalQ

                     day of year of 25-percent of total volumetric discharge

Date_25pct_TotalQ

                     date (YYYY-MM-DD) of 25-percent of total volumetric discharge

DoY_33.3pct_TotalQ

                     day of year of 33.3-percent of total volumetric discharge

Date_33.3pct_TotalQ

                     date (YYYY-MM-DD) of 33.3-percent of total volumetric discharge

DoY_50pct_TotalQ

                     day of year of 50-percent of total volumetric discharge

Date_50pct_TotalQ

                     date (YYYY-MM-DD) of 50-percent of total volumetric discharge

DoY_75pct_TotalQ

                     day of year of 75-percent of total volumetric discharge

Date_75pct_TotalQ

                     date (YYYY-MM-DD) of 75-percent of total volumetric discharge

Transposing data creates a column of 'Statistics' (just DoY, not Date values) and subsequent columns
for each year selected.

calc_annual_lowflows   *Calculate annual low flows and dates*

Description

Calculates annual n-day minimum values, and the day of year and date of occurrence of daily flow values from a daily streamflow data set. Calculates statistics from all values, unless specified. Returns a tibble with statistics.

Usage

```
calc_annual_lowflows(
  data,
  dates = Date,
  values = Value,
  groups = STATION_NUMBER,
  station_number,
  roll_days = c(1, 3, 7, 30),
  roll_align = "right",
  water_year_start = 1,
  start_year,
  end_year,
  exclude_years,
  months = 1:12,
  transpose = FALSE,
  ignore_missing = FALSE
)
```

Arguments

data	Data frame of daily data that contains columns of dates, flow values, and (optional) groups (e.g. station numbers). Leave blank if using station_number argument.
dates	Name of column in data that contains dates formatted YYYY-MM-DD. Only required if dates column name is not 'Date' (default). Leave blank if using station_number argument.
values	Name of column in data that contains numeric flow values, in units of cubic metres per second. Only required if values column name is not 'Value' (default). Leave blank if using station_number argument.
groups	Name of column in data that contains unique identifiers for different data sets, if applicable. Only required if groups column name is not 'STATION_NUMBER'. Function will automatically group by a column named 'STATION_NUMBER' if present. Remove the 'STATION_NUMBER' column beforehand to remove this grouping. Leave blank if using station_number argument.
station_number	Character string vector of seven digit Water Survey of Canada station numbers (e.g. "08NM116") of which to extract daily streamflow data from a HYDAT database. Requires tidyhydat package and a HYDAT database. Leave blank if using data argument.
roll_days	Numeric value of the number of days to apply a rolling mean. Default 1.
roll_align	Character string identifying the direction of the rolling mean from the specified date, either by the first ('left'), last ('right'), or middle ('center') day of the rolling n-day group of observations. Default 'right'.
water_year_start	Numeric value indicating the month (1 through 12) of the start of water year for analysis. Default 1.
start_year	Numeric value of the first year to consider for analysis. Leave blank to use the first year of the source data.
end_year	Numeric value of the last year to consider for analysis. Leave blank to use the last year of the source data.
exclude_years	Numeric vector of years to exclude from analysis. Leave blank to include all years.
months	Numeric vector of months to include in analysis (e.g. 6:8 for Jun-Aug). Leave blank to summarize all months (default 1:12).
transpose	Logical value indicating whether to transpose rows and columns of results. Default FALSE.
ignore_missing	Logical value indicating whether dates with missing values should be included in the calculation. If TRUE then a statistic will be calculated regardless of missing dates. If FALSE then only those statistics from time periods with no missing dates will be returned. Default FALSE.

Value

A tibble data frame with the following columns:

Year   calendar or water year selected

Min_'n'_Day   annual minimum for each n-day rolling mean, direction of mean specified by
                        roll_align

Min_'n'_Day_DoY

                        day of year for each annual minimum of n-day rolling mean

Min_'n'_Day_Date

                        date (YYYY-MM-DD) for each annual minimum of n-day rolling mean

Default columns:

Min_1_Day   annual 1-day mean minimum (roll_align = right)

Min_1_Day_DoY   day of year of annual 1-day mean minimum

Min_1_Day_Date   date (YYYY-MM-DD) of annual 1-day mean minimum

Min_3_Day   annual 3-day mean minimum (roll_align = right)

Min_3_Day_DoY   day of year of annual 3-day mean minimum

Min_3_Day_Date   date (YYYY-MM-DD) of annual 3-day mean minimum

Min_7_Day   annual 7-day mean minimum (roll_align = right)

Min_7_Day_DoY   day of year of annual 7-day mean minimum

Min_7_Day_Date   date (YYYY-MM-DD) of annual 7-day mean minimum

Min_30_Day   annual 30-day mean minimum (roll_align = right)

Min_30_Day_DoY   day of year of annual 30-day mean minimum

Min_30_Day_Date

                        date (YYYY-MM-DD) of annual 30-day mean minimum

Transposing data creates a column of 'Statistics' and subsequent columns for each year selected.
'Date' statistics not transposed.

Examples

```
# Run if HYDAT database has been downloaded (using tidyhydat::download_hydat())
if (file.exists(tidyhydat::hy_downloaded_db())) {

# Calculate annual 1, 3, 7, and 30-day (default) low flows with
# default alignment ('right')
calc_annual_lowflows(station_number = "08NM116")

# Calculate custom 3 and 7-day annual low flows with 'center' alignment
calc_annual_lowflows(station_number = "08NM116",
                     roll_days = c(3,7),
                     roll_align = "center")

}
```

calc_annual_outside_normal

Calculate annual days above and below normal

Description

Calculates the number of days per year outside of the 'normal' range (typically between 25 and 75th percentiles) for each day of the year. Upper and lower-range percentiles are calculated for each day of the year of from all years, and then each daily flow value for each year is compared. All days above or below the normal range are included. Analysis methodology is based on Environment and Climate Change Canada's Water Quantity indicator from the Canadian Environmental Sustainability Indicators. Calculates statistics from all values from complete years, unless specified. Returns a tibble with statistics.

Usage

```
calc_annual_outside_normal(
  data,
  dates = Date,
  values = Value,
  groups = STATION_NUMBER,
  station_number,
  normal_percentiles = c(25, 75),
  roll_days = 1,
  roll_align = "right",
  water_year_start = 1,
  start_year,
  end_year,
  exclude_years,
  months = 1:12,
  transpose = FALSE
)
```

Arguments

data	Data frame of daily data that contains columns of dates, flow values, and (optional) groups (e.g. station numbers). Leave blank if using `station_number` argument.
dates	Name of column in `data` that contains dates formatted YYYY-MM-DD. Only required if dates column name is not 'Date' (default). Leave blank if using `station_number` argument.
values	Name of column in `data` that contains numeric flow values, in units of cubic metres per second. Only required if values column name is not 'Value' (default). Leave blank if using `station_number` argument.
groups	Name of column in `data` that contains unique identifiers for different data sets, if applicable. Only required if groups column name is not 'STATION_NUMBER'.

Function will automatically group by a column named 'STATION_NUMBER' if present. Remove the 'STATION_NUMBER' column beforehand to remove this grouping. Leave blank if using `station_number` argument.

station_number   Character string vector of seven digit Water Survey of Canada station numbers (e.g. `"08NM116"`) of which to extract daily streamflow data from a HYDAT database. Requires `tidyhydat` package and a HYDAT database. Leave blank if using `data` argument.

normal_percentiles

Numeric vector of two values, lower and upper percentiles, respectively indicating the limits of the normal range. Default `c(25,75)`.

roll_days   Numeric value of the number of days to apply a rolling mean. Default 1.

roll_align   Character string identifying the direction of the rolling mean from the specified date, either by the first (`'left'`), last (`'right'`), or middle (`'center'`) day of the rolling n-day group of observations. Default `'right'`.

water_year_start

Numeric value indicating the month (1 through 12) of the start of water year for analysis. Default 1.

start_year   Numeric value of the first year to consider for analysis. Leave blank to use the first year of the source data.

end_year   Numeric value of the last year to consider for analysis. Leave blank to use the last year of the source data.

exclude_years   Numeric vector of years to exclude from analysis. Leave blank to include all years.

months   Numeric vector of months to include in analysis (e.g. `6:8` for Jun-Aug). Leave blank to summarize all months (default `1:12`).

transpose   Logical value indicating whether to transpose rows and columns of results. Default `FALSE`.

Value

A tibble data frame with the following columns:

Year   calendar or water year selected

Days_Below_Normal

number of days per year below the daily normal (default 25th percentile)

Days_Above_Normal

number of days per year above the daily normal (default 75th percentile)

Days_Outside_Normal

number of days per year below and above the daily normal (default 25/75th percentile)

Transposing data creates a column of "Statistics" and subsequent columns for each year selected.

Examples

```
# Run if HYDAT database has been downloaded (using tidyhydat::download_hydat())
if (file.exists(tidyhydat::hy_downloaded_db())) {

# Calculate statistics with default limits of normal (25 and 75th percentiles)
calc_annual_outside_normal(station_number = "08NM116")

# Calculate statistics with custom limits of normal
calc_annual_outside_normal(station_number = "08NM116",
                           normal_percentiles = c(10,90))

}
```

---

calc_annual_peaks   *Calculate annual peak flows*

Description

Calculates annual n-day minimum and maximum values, and the day of year and date of occurrence of daily flow values from a daily streamflow data set. Calculates statistics from all values, unless specified. Returns a tibble with statistics.

Usage

```
calc_annual_peaks(
  data,
  dates = Date,
  values = Value,
  groups = STATION_NUMBER,
  station_number,
  roll_days = 1,
  roll_align = "right",
  water_year_start = 1,
  start_year,
  end_year,
  exclude_years,
  months = 1:12,
  transpose = FALSE,
  ignore_missing = FALSE
)
```

Arguments

data   Data frame of daily data that contains columns of dates, flow values, and (optional) groups (e.g. station numbers). Leave blank if using station_number argument.

dates	Name of column in `data` that contains dates formatted YYYY-MM-DD. Only required if dates column name is not 'Date' (default). Leave blank if using `station_number` argument.
values	Name of column in `data` that contains numeric flow values, in units of cubic metres per second. Only required if values column name is not 'Value' (default). Leave blank if using `station_number` argument.
groups	Name of column in `data` that contains unique identifiers for different data sets, if applicable. Only required if groups column name is not 'STATION_NUMBER'. Function will automatically group by a column named 'STATION_NUMBER' if present. Remove the 'STATION_NUMBER' column beforehand to remove this grouping. Leave blank if using `station_number` argument.
station_number	Character string vector of seven digit Water Survey of Canada station numbers (e.g. `"08NM116"`) of which to extract daily streamflow data from a HYDAT database. Requires `tidyhydat` package and a HYDAT database. Leave blank if using `data` argument.
roll_days	Numeric value of the number of days to apply a rolling mean. Default 1.
roll_align	Character string identifying the direction of the rolling mean from the specified date, either by the first (`'left'`), last (`'right'`), or middle (`'center'`) day of the rolling n-day group of observations. Default `'right'`.
water_year_start	Numeric value indicating the month (1 through 12) of the start of water year for analysis. Default 1.
start_year	Numeric value of the first year to consider for analysis. Leave blank to use the first year of the source data.
end_year	Numeric value of the last year to consider for analysis. Leave blank to use the last year of the source data.
exclude_years	Numeric vector of years to exclude from analysis. Leave blank to include all years.
months	Numeric vector of months to include in analysis (e.g. `6:8` for Jun-Aug). Leave blank to summarize all months (default `1:12`).
transpose	Logical value indicating whether to transpose rows and columns of results. Default `FALSE`.
ignore_missing	Logical value indicating whether dates with missing values should be included in the calculation. If `TRUE` then a statistic will be calculated regardless of missing dates. If `FALSE` then only those statistics from time periods with no missing dates will be returned. Default `FALSE`.

Value

A tibble data frame with the following columns:

Year	calendar or water year selected
Min_'n'_Day	annual minimum for selected n-day rolling mean, direction of mean specified by roll_align
Min_'n'_Day_DoY	day of year for selected annual minimum of n-day rolling mean

Min_'n'_Day_Date

> date (YYYY-MM-DD) for selected annual minimum of n-day rolling mean

Max_'n'_Day annual maximum for selected n-day rolling mean, direction of mean specified by roll_align

Max_'n'_Day_DoY

> day of year for selected annual maximum of n-day rolling mean

Max_'n'_Day_Date

> date (YYYY-MM-DD) for selected annual maximum of n-day rolling mean

Default columns:

Min_1_Day annual 1-day mean minimum (roll_align = right)

Min_1_Day_DoY day of year of annual 1-day mean minimum

Min_1_Day_Date date (YYYY-MM-DD) of annual 1-day mean minimum

Max_1_Day annual 1-day mean maximum (roll_align = right)

Max_1_Day_DoY day of year of annual 1-day mean maximum

Max_1_Day_Date date (YYYY-MM-DD) of annual 1-day mean maximum

Transposing data creates a column of 'Statistics' and subsequent columns for each year selected. 'Date' statistics not transposed.

Examples

```
# Run if HYDAT database has been downloaded (using tidyhydat::download_hydat())
if (file.exists(tidyhydat::hy_downloaded_db())) {

# Calculate annual 1-day (default) peak flow data with
# default alignment ('right')
calc_annual_peaks(station_number = "08NM116")

# Calculate custom 3-day peak flow data with 'center' alignment
calc_annual_peaks(station_number = "08NM116",
                  roll_days = 3,
                  roll_align = "center")

}
```

---

calc_annual_stats *Calculate annual summary statistics*

Description

Calculates means, medians, maximums, minimums, and percentiles for each year from all years of a daily streamflow data set. Calculates statistics from all values, unless specified. Returns a tibble with statistics.

Usage

```
calc_annual_stats(
  data,
  dates = Date,
  values = Value,
  groups = STATION_NUMBER,
  station_number,
  roll_days = 1,
  roll_align = "right",
  percentiles = c(10, 90),
  water_year_start = 1,
  start_year,
  end_year,
  exclude_years,
  months = 1:12,
  transpose = FALSE,
  ignore_missing = FALSE
)
```

Arguments

data	Data frame of daily data that contains columns of dates, flow values, and (optional) groups (e.g. station numbers). Leave blank if using `station_number` argument.
dates	Name of column in `data` that contains dates formatted YYYY-MM-DD. Only required if dates column name is not 'Date' (default). Leave blank if using `station_number` argument.
values	Name of column in `data` that contains numeric flow values, in units of cubic metres per second. Only required if values column name is not 'Value' (default). Leave blank if using `station_number` argument.
groups	Name of column in `data` that contains unique identifiers for different data sets, if applicable. Only required if groups column name is not 'STATION_NUMBER'. Function will automatically group by a column named 'STATION_NUMBER' if present. Remove the 'STATION_NUMBER' column beforehand to remove this grouping. Leave blank if using `station_number` argument.
station_number	Character string vector of seven digit Water Survey of Canada station numbers (e.g. `"08NM116"`) of which to extract daily streamflow data from a HYDAT database. Requires `tidyhydat` package and a HYDAT database. Leave blank if using `data` argument.
roll_days	Numeric value of the number of days to apply a rolling mean. Default 1.
roll_align	Character string identifying the direction of the rolling mean from the specified date, either by the first (`'left'`), last (`'right'`), or middle (`'center'`) day of the rolling n-day group of observations. Default `'right'`.
percentiles	Numeric vector of percentiles to calculate. Set to NA if none required. Default `c(10,90)`.

water_year_start

> Numeric value indicating the month (1 through 12) of the start of water year for analysis. Default 1.

start_year   Numeric value of the first year to consider for analysis. Leave blank to use the first year of the source data.

end_year   Numeric value of the last year to consider for analysis. Leave blank to use the last year of the source data.

exclude_years Numeric vector of years to exclude from analysis. Leave blank to include all years.

months   Numeric vector of months to include in analysis (e.g. 6:8 for Jun-Aug). Leave blank to summarize all months (default 1:12).

transpose   Logical value indicating whether to transpose rows and columns of results. Default FALSE.

ignore_missing Logical value indicating whether dates with missing values should be included in the calculation. If TRUE then a statistic will be calculated regardless of missing dates. If FALSE then only those statistics from time periods with no missing dates will be returned. Default FALSE.

Value

A tibble data frame with the following columns:

Year   calendar or water year selected

Mean   annual mean of all daily flows for a given year

Median   annual median of all daily flows for a given year

Maximum   annual maximum of all daily flows for a given year

Minimum   annual minimum of all daily flows for a given year

P'n'   each annual n-th percentile selected of all daily flows

Default percentile columns:

P10   annual 10th percentile of all daily flows for a given year

P90   annual 90th percentile of all daily flows for a given year

Transposing data creates a column of "Statistics" and subsequent columns for each year selected.

Examples

```
# Run if HYDAT database has been downloaded (using tidyhydat::download_hydat())
if (file.exists(tidyhydat::hy_downloaded_db())) {

# Calculate annual statistics from a data frame using the data argument
flow_data <- tidyhydat::hy_daily_flows(station_number = "08NM116")
calc_annual_stats(data = flow_data)

# Calculate annual statistics using station_number argument
calc_annual_stats(station_number = "08NM116")
```

```
# Calculate annual statistics regardless if there
# is missing data for a given year
calc_annual_stats(station_number = "08NM116",
                  ignore_missing = TRUE)

# Calculate annual statistics for water years starting in October
calc_annual_stats(station_number = "08NM116",
                  water_year_start = 10)

# Calculate annual statistics filtered for custom years
calc_annual_stats(station_number = "08NM116",
                  start_year = 1981,
                  end_year = 2010,
                  exclude_years = c(1991,1993:1995))

# Calculate annual statistics for 7-day flows for July-September
# months only, with 25 and 75th percentiles
calc_annual_stats(station_number = "08NM116",
                  roll_days = 7,
                  months = 7:9,
                  percentiles = c(25,75))

}
```

---

calc_daily_cumulative_stats
                    Calculate cumulative daily flow statistics

---

Description

Calculate cumulative daily flow statistics for each day of the year of daily flow values from a daily streamflow data set. Defaults to volumetric cumulative flows, can use `use_yield` and `basin_area` to convert to area-based water yield. Calculates statistics from all values from all complete years, unless specified. Returns a tibble with statistics.

Usage

```
calc_daily_cumulative_stats(
  data,
  dates = Date,
  values = Value,
  groups = STATION_NUMBER,
  station_number,
  percentiles = c(5, 25, 75, 95),
  use_yield = FALSE,
  basin_area,
  water_year_start = 1,
  start_year,
  end_year,
```

```
    exclude_years,
    transpose = FALSE
)
```

Arguments

data	Data frame of daily data that contains columns of dates, flow values, and (optional) groups (e.g. station numbers). Leave blank if using `station_number` argument.
dates	Name of column in `data` that contains dates formatted YYYY-MM-DD. Only required if dates column name is not 'Date' (default). Leave blank if using `station_number` argument.
values	Name of column in `data` that contains numeric flow values, in units of cubic metres per second. Only required if values column name is not 'Value' (default). Leave blank if using `station_number` argument.
groups	Name of column in `data` that contains unique identifiers for different data sets, if applicable. Only required if groups column name is not 'STATION_NUMBER'. Function will automatically group by a column named 'STATION_NUMBER' if present. Remove the 'STATION_NUMBER' column beforehand to remove this grouping. Leave blank if using `station_number` argument.
station_number	Character string vector of seven digit Water Survey of Canada station numbers (e.g. `"08NM116"`) of which to extract daily streamflow data from a HYDAT database. Requires `tidyhydat` package and a HYDAT database. Leave blank if using `data` argument.
percentiles	Numeric vector of percentiles to calculate. Set to `NA` if none required. Default `c(5,25,75,95)`.
use_yield	Logical value indicating whether to calculate area-based water yield, in mm, instead of volumetric discharge. Default `FALSE`.
basin_area	Upstream drainage basin area, in square kilometres, to apply to observations. Three options: (1) Leave blank if `groups` is STATION_NUMBER with HYDAT station numbers to extract basin areas from HYDAT. (2) A single numeric value to apply to all observations. (3) List each basin area for each group/station in groups (can override HYDAT value if listed) as such `c("08NM116" = 795,"08NM242" = 10)`. If group is not listed the HYDAT area will be applied if it exists, otherwise it will be NA.
water_year_start	Numeric value indicating the month (1 through 12) of the start of water year for analysis. Default 1.
start_year	Numeric value of the first year to consider for analysis. Leave blank to use the first year of the source data.
end_year	Numeric value of the last year to consider for analysis. Leave blank to use the last year of the source data.
exclude_years	Numeric vector of years to exclude from analysis. Leave blank to include all years.
transpose	Logical value indicating whether to transpose rows and columns of results. Default `FALSE`.

Value

A data frame with the following columns, default units in cubic metres, millimetres if use_yield and basin_area provided:

Date	date (MMM-DD) of daily cumulative statistics
DayofYear	day of year of daily cumulative statistics
Mean	daily mean of all cumulative flows for a given day of the year
Median	daily mean of all cumulative flows for a given day of the year
Maximum	daily mean of all cumulative flows for a given day of the year
Minimum	daily mean of all cumulative flows for a given day of the year
P'n'	each daily n-th percentile selected of all cumulative flows for a given day of the year

Default percentile columns:

P5	daily 5th percentile of all cumulative flows for a given day of the year
P25	daily 25th percentile of all cumulative flows for a given day of the year
P75	daily 75th percentile of all cumulative flows for a given day of the year
P95	daily 95th percentile of all cumulative flows for a given day of the year

Transposing data creates a column of "Statistics" and subsequent columns for each year selected.

Examples

```
# Run if HYDAT database has been downloaded (using tidyhydat::download_hydat())
if (file.exists(tidyhydat::hy_downloaded_db())) {

# Calculate annual daily cumulative volume statistics
calc_daily_cumulative_stats(station_number = "08NM116")

# Calculate annual daily cumulative yield statistics
# with default HYDAT basin area
calc_daily_cumulative_stats(station_number = "08NM116",
                            use_yield = TRUE)

# Calculate annual daily cumulative yield statistics
# with custom basin area
calc_daily_cumulative_stats(station_number = "08NM116",
                            use_yield = TRUE,
                            basin_area = 800)

}
```

---

calc_daily_stats *Calculate daily summary statistics*

Description

Calculates means, medians, maximums, minimums, and percentiles for each day of the year of flow values from a daily streamflow data set. Can determine statistics of rolling mean days (e.g. 7-day flows) using the `roll_days` argument. Note that statistics are based on the numeric days of year (1-365) and not the date of year (Jan 1 - Dec 31). Calculates statistics from all values, unless specified. Returns a tibble with statistics.

Usage

```
calc_daily_stats(
  data,
  dates = Date,
  values = Value,
  groups = STATION_NUMBER,
  station_number,
  percentiles = c(5, 25, 75, 95),
  roll_days = 1,
  roll_align = "right",
  water_year_start = 1,
  start_year,
  end_year,
  exclude_years,
  complete_years = FALSE,
  months = 1:12,
  transpose = FALSE,
  ignore_missing = FALSE
)
```

Arguments

data	Data frame of daily data that contains columns of dates, flow values, and (optional) groups (e.g. station numbers). Leave blank if using `station_number` argument.
dates	Name of column in `data` that contains dates formatted YYYY-MM-DD. Only required if dates column name is not 'Date' (default). Leave blank if using `station_number` argument.
values	Name of column in `data` that contains numeric flow values, in units of cubic metres per second. Only required if values column name is not 'Value' (default). Leave blank if using `station_number` argument.
groups	Name of column in `data` that contains unique identifiers for different data sets, if applicable. Only required if groups column name is not 'STATION_NUMBER'. Function will automatically group by a column named 'STATION_NUMBER'

if present. Remove the 'STATION_NUMBER' column beforehand to remove this grouping. Leave blank if using `station_number` argument.

station_number   Character string vector of seven digit Water Survey of Canada station numbers (e.g. `"08NM116"`) of which to extract daily streamflow data from a HYDAT database. Requires `tidyhydat` package and a HYDAT database. Leave blank if using `data` argument.

percentiles   Numeric vector of percentiles to calculate. Set to NA if none required. Default `c(5,25,75,95)`.

roll_days   Numeric value of the number of days to apply a rolling mean. Default 1.

roll_align   Character string identifying the direction of the rolling mean from the specified date, either by the first (`'left'`), last (`'right'`), or middle (`'center'`) day of the rolling n-day group of observations. Default `'right'`.

water_year_start
    Numeric value indicating the month (1 through 12) of the start of water year for analysis. Default 1.

start_year   Numeric value of the first year to consider for analysis. Leave blank to use the first year of the source data.

end_year   Numeric value of the last year to consider for analysis. Leave blank to use the last year of the source data.

exclude_years   Numeric vector of years to exclude from analysis. Leave blank to include all years.

complete_years   Logical values indicating whether to include only years with complete data in analysis. Default `FALSE`.

months   Numeric vector of months to include in analysis (e.g. `6:8` for Jun-Aug). Leave blank to summarize all months (default `1:12`).

transpose   Logical value indicating whether to transpose rows and columns of results. Default `FALSE`.

ignore_missing   Logical value indicating whether dates with missing values should be included in the calculation. If `TRUE` then a statistic will be calculated regardless of missing dates. If `FALSE` then only those statistics from time periods with no missing dates will be returned. Default `FALSE`.

Value

A tibble data frame with the following columns:

Date	date (MMM-DD) of daily statistics
DayofYear	day of year of daily statistics
Mean	daily mean of all flows for a given day of the year
Median	daily mean of all flows for a given day of the year
Maximum	daily mean of all flows for a given day of the year
Minimum	daily mean of all flows for a given day of the year
P'n'	each daily n-th percentile selected of all flows for a given day of the year

Default percentile columns:

P5	daily 5th percentile of all flows for a given day of the year
P25	daily 25th percentile of all flows for a given day of the year
P75	daily 75th percentile of all flows for a given day of the year
P95	daily 95th percentile of all flows for a given day of the year

Transposing data creates a column of "Statistics" and subsequent columns for each year selected.

Examples

```
# Run if HYDAT database has been downloaded (using tidyhydat::download_hydat())
if (file.exists(tidyhydat::hy_downloaded_db())) {

# Calculate daily statistics using data argument with defaults
flow_data <- tidyhydat::hy_daily_flows(station_number = "08NM116")
calc_daily_stats(data = flow_data,
                 start_year = 1980)

# Calculate daily statistics using station_number argument with defaults
calc_daily_stats(station_number = "08NM116",
                 start_year = 1980)

# Calculate daily statistics regardless if there is missing data for a given day of year
calc_daily_stats(station_number = "08NM116",
                 ignore_missing = TRUE)

# Calculate daily statistics using only years with no missing data
calc_daily_stats(station_number = "08NM116",
                 complete_years = TRUE)

# Calculate daily statistics for water years starting in October between 1980 and 2010
calc_daily_stats(station_number = "08NM116",
                 start_year = 1980,
                 end_year = 2010,
                 water_year_start = 10)

# Calculate daily statistics with custom years and removing certain years
calc_daily_stats(station_number = "08NM116",
                 start_year = 1981,
                 end_year = 2010,
                 exclude_years = c(1991,1993:1995))

# Calculate daily statistics for 7-day flows for July-September months only,
# with 25 and 75th percentiles starting in 1980
calc_daily_stats(station_number = "08NM116",
                 start_year = 1980,
                 roll_days = 7,
                 months = 7:9,
                 percentiles = c(25,75))

}
```

---

calc_flow_percentile   *Calculate the percentile rank of a flow value*

Description

Calculates the percentile rank of a discharge value compared to all flow values of a streamflow data set. Looks up the value in the distribution (stats::ecdf() function) of all daily discharge values from all years, unless specified. Returns a tibble with statistics.

Usage

```
calc_flow_percentile(
  data,
  dates = Date,
  values = Value,
  groups = STATION_NUMBER,
  station_number,
  roll_days = 1,
  roll_align = "right",
  flow_value,
  water_year_start = 1,
  start_year,
  end_year,
  exclude_years,
  complete_years = FALSE,
  months = 1:12
)
```

Arguments

data	Data frame of daily data that contains columns of dates, flow values, and (optional) groups (e.g. station numbers). Leave blank if using station_number argument.
dates	Name of column in data that contains dates formatted YYYY-MM-DD. Only required if dates column name is not 'Date' (default). Leave blank if using station_number argument.
values	Name of column in data that contains numeric flow values, in units of cubic metres per second. Only required if values column name is not 'Value' (default). Leave blank if using station_number argument.
groups	Name of column in data that contains unique identifiers for different data sets, if applicable. Only required if groups column name is not 'STATION_NUMBER'. Function will automatically group by a column named 'STATION_NUMBER' if present. Remove the 'STATION_NUMBER' column beforehand to remove this grouping. Leave blank if using station_number argument.

station_number Character string vector of seven digit Water Survey of Canada station numbers (e.g. "08NM116") of which to extract daily streamflow data from a HYDAT database. Requires tidyhydat package and a HYDAT database. Leave blank if using data argument.

roll_days Numeric value of the number of days to apply a rolling mean. Default 1.

roll_align Character string identifying the direction of the rolling mean from the specified date, either by the first ('left'), last ('right'), or middle ('center') day of the rolling n-day group of observations. Default 'right'.

flow_value A numeric flow value of which to determine the percentile rank. Required.

water_year_start
Numeric value indicating the month (1 through 12) of the start of water year for analysis. Default 1.

start_year Numeric value of the first year to consider for analysis. Leave blank to use the first year of the source data.

end_year Numeric value of the last year to consider for analysis. Leave blank to use the last year of the source data.

exclude_years Numeric vector of years to exclude from analysis. Leave blank to include all years.

complete_years Logical values indicating whether to include only years with complete data in analysis. Default FALSE.

months Numeric vector of months to include in analysis (e.g. 6:8 for Jun-Aug). Leave blank to summarize all months (default 1:12).

Value

A tibble data frame, or a single numeric value if no station number provided, of the percentile rank of a given flow value.

Examples

```
# Run if HYDAT database has been downloaded (using tidyhydat::download_hydat())
if (file.exists(tidyhydat::hy_downloaded_db())) {

# Calculate the percentile rank of a 10-cms flow value from a full record
calc_flow_percentile(station_number = "08NM116",
                     flow_value = 10)

# Calculate the percentile rank of a 10-cms flow value from years with no missing data
calc_flow_percentile(station_number = "08NM116",
                     complete_years = TRUE,
                     flow_value = 10)

# Calculate the percentile rank of a 10-cms flow value for June from years with no missing data
calc_flow_percentile(station_number = "08NM116",
                     complete_years = TRUE,
                     months = 6,
                     flow_value = 10)

}
```

---

calc_longterm_daily_stats

Calculate long-term summary statistics from daily mean flows

Description

Calculates the long-term mean, median, maximum, minimum, and percentiles of daily flow values for over all months and all data (Long-term) from a daily streamflow data set. Calculates statistics from all values, unless specified. Returns a tibble with statistics.

Usage

```
calc_longterm_daily_stats(
  data,
  dates = Date,
  values = Value,
  groups = STATION_NUMBER,
  station_number,
  percentiles = c(10, 90),
  roll_days = 1,
  roll_align = "right",
  water_year_start = 1,
  start_year,
  end_year,
  exclude_years,
  months = 1:12,
  complete_years = FALSE,
  include_longterm = TRUE,
  custom_months,
  custom_months_label,
  transpose = FALSE,
  ignore_missing = FALSE
)
```

Arguments

data	Data frame of daily data that contains columns of dates, flow values, and (optional) groups (e.g. station numbers). Leave blank if using station_number argument.
dates	Name of column in data that contains dates formatted YYYY-MM-DD. Only required if dates column name is not 'Date' (default). Leave blank if using station_number argument.
values	Name of column in data that contains numeric flow values, in units of cubic metres per second. Only required if values column name is not 'Value' (default). Leave blank if using station_number argument.

groups	Name of column in data that contains unique identifiers for different data sets, if applicable. Only required if groups column name is not 'STATION_NUMBER'. Function will automatically group by a column named 'STATION_NUMBER' if present. Remove the 'STATION_NUMBER' column beforehand to remove this grouping. Leave blank if using station_number argument.
station_number	Character string vector of seven digit Water Survey of Canada station numbers (e.g. "08NM116") of which to extract daily streamflow data from a HYDAT database. Requires tidyhydat package and a HYDAT database. Leave blank if using data argument.
percentiles	Numeric vector of percentiles to calculate. Set to NA if none required. Default c(10,90).
roll_days	Numeric value of the number of days to apply a rolling mean. Default 1.
roll_align	Character string identifying the direction of the rolling mean from the specified date, either by the first ('left'), last ('right'), or middle ('center') day of the rolling n-day group of observations. Default 'right'.
water_year_start	
	Numeric value indicating the month (1 through 12) of the start of water year for analysis. Default 1.
start_year	Numeric value of the first year to consider for analysis. Leave blank to use the first year of the source data.
end_year	Numeric value of the last year to consider for analysis. Leave blank to use the last year of the source data.
exclude_years	Numeric vector of years to exclude from analysis. Leave blank to include all years.
months	Numeric vector of months to include in analysis (e.g. 6:8 for Jun-Aug). Leave blank to summarize all months (default 1:12).
complete_years	Logical values indicating whether to include only years with complete data in analysis. Default FALSE.
include_longterm	
	Logical value indicating whether to include long-term calculation of all data. Default TRUE.
custom_months	Numeric vector of months to combine to summarize (ex. 6:8 for Jun-Aug). Adds results to the end of table. If wanting months that overlap calendar years (ex. Oct-Mar), choose water_year_start that begins before the first month listed. Leave blank for no custom month summary.
custom_months_label	
	Character string to label custom months. For example, if months = 7:9 you may choose "Summer" or "Jul-Sep". Default "Custom-Months".
transpose	Logical value indicating whether to transpose rows and columns of results. Default FALSE.
ignore_missing	Logical value indicating whether dates with missing values should be included in the calculation. If TRUE then a statistic will be calculated regardless of missing dates. If FALSE then only those statistics from time periods with no missing dates will be returned. Default FALSE.

Value

A tibble data frame with the following columns:

Month   month of the year, included 'Long-term' for all months, and 'Custom-Months'
                 if selected

Mean   mean of all daily data for a given month and long-term over all years

Median   median of all daily data for a given month and long-term over all years

Maximum   maximum of all daily data for a given month and long-term over all years

Minimum   minimum of all daily data for a given month and long-term over all years

P'n'   each n-th percentile selected for a given month and long-term over all years

Default percentile columns:

P10   annual 10th percentile selected for a given month and long-term over all years

P90   annual 90th percentile selected for a given month and long-term over all years

Transposing data creates a column of "Statistics" and subsequent columns for each year selected.

Examples

```
# Run if HYDAT database has been downloaded (using tidyhydat::download_hydat())
if (file.exists(tidyhydat::hy_downloaded_db())) {

# Calculate long-term statistics using data argument with defaults
flow_data <- tidyhydat::hy_daily_flows(station_number = "08NM116")
calc_longterm_daily_stats(data = flow_data,
                          start_year = 1980)

# Calculate long-term statistics using station_number argument with defaults
calc_longterm_daily_stats(station_number = "08NM116",
                          start_year = 1980)

# Calculate long-term statistics regardless if there is missing data for a given year
calc_longterm_daily_stats(station_number = "08NM116",
                          ignore_missing = TRUE)

# Calculate long-term statistics for water years starting in October
calc_longterm_daily_stats(station_number = "08NM116",
                          start_year = 1980,
                          water_year_start = 10)

# Calculate long-term statistics with custom years
calc_longterm_daily_stats(station_number = "08NM116",
                          start_year = 1981,
                          end_year = 2010,
                          exclude_years = c(1991,1993:1995))

# Calculate long-term statistics for 7-day flows for July-September months only,
# with 25 and 75th percentiles
calc_longterm_daily_stats(station_number = "08NM116",
```

```
                              roll_days = 7,
                              months = 7:9,
                              percentiles = c(25,75),
                              ignore_missing = TRUE,
                              include_longterm = FALSE) # removes the Long-term numbers

  # Calculate long-term statistics and add custom stats for July-September
  calc_longterm_daily_stats(station_number = "08NM116",
                            start_year = 1980,
                            custom_months = 7:9,
                            custom_months_label = "Summer")

  }
```

---

calc_longterm_mean   *Calculate the long-term mean annual discharge*

Description

Calculates the long-term mean annual discharge (MAD) from a daily streamflow data set. Calculates statistics from all values, unless specified. Returns a tibble with statistics.

Usage

```
calc_longterm_mean(
  data,
  dates = Date,
  values = Value,
  groups = STATION_NUMBER,
  station_number,
  roll_days = 1,
  roll_align = "right",
  water_year_start = 1,
  start_year,
  end_year,
  exclude_years,
  complete_years = FALSE,
  months = 1:12,
  percent_MAD,
  transpose = FALSE
)
```

Arguments

data   Data frame of daily data that contains columns of dates, flow values, and (optional) groups (e.g. station numbers). Leave blank if using station_number argument.

dates   Name of column in data that contains dates formatted YYYY-MM-DD. Only
                         required if dates column name is not 'Date' (default). Leave blank if using
                         station_number argument.

values   Name of column in data that contains numeric flow values, in units of cubic
                         metres per second. Only required if values column name is not 'Value' (default).
                         Leave blank if using station_number argument.

groups   Name of column in data that contains unique identifiers for different data sets, if
                         applicable. Only required if groups column name is not 'STATION_NUMBER'.
                         Function will automatically group by a column named 'STATION_NUMBER'
                         if present. Remove the 'STATION_NUMBER' column beforehand to remove
                         this grouping. Leave blank if using station_number argument.

station_number   Character string vector of seven digit Water Survey of Canada station numbers
                         (e.g. "08NM116") of which to extract daily streamflow data from a HYDAT
                         database. Requires tidyhydat package and a HYDAT database. Leave blank if
                         using data argument.

roll_days   Numeric value of the number of days to apply a rolling mean. Default 1.

roll_align   Character string identifying the direction of the rolling mean from the specified
                         date, either by the first ('left'), last ('right'), or middle ('center') day of
                         the rolling n-day group of observations. Default 'right'.

water_year_start
                         Numeric value indicating the month (1 through 12) of the start of water year for
                         analysis. Default 1.

start_year   Numeric value of the first year to consider for analysis. Leave blank to use the
                         first year of the source data.

end_year   Numeric value of the last year to consider for analysis. Leave blank to use the
                         last year of the source data.

exclude_years   Numeric vector of years to exclude from analysis. Leave blank to include all
                         years.

complete_years   Logical values indicating whether to include only years with complete data in
                         analysis. Default FALSE.

months   Numeric vector of months to include in analysis (e.g. 6:8 for Jun-Aug). Leave
                         blank to summarize all months (default 1:12).

percent_MAD   Numeric vector of percents of long-term mean annual discharge to add to the ta-
                         ble (ex. 20 for 20 percent MAD or c(5,10,20) for multiple portions of MAD).
                         Leave blank for no values to be calculated.

transpose   Logical value indicating whether to transpose rows and columns of results. De-
                         fault FALSE.

Value

A tibble data frame of numeric values of a long-term mean (and percent of long-term mean if
selected) of selected years and months.

Examples

```
# Run if HYDAT database has been downloaded (using tidyhydat::download_hydat())
if (file.exists(tidyhydat::hy_downloaded_db())) {

# Calculate the long-term mean annual discharge (MAD) using only years with no missing data
calc_longterm_mean(station_number = "08NM116",
                   complete_years = TRUE)

# Calculate the long-term MAD and 5, 10 and 20-percent MADs using only years with no missing data
calc_longterm_mean(station_number = "08NM116",
                   complete_years = TRUE,
                   percent_MAD = c(5,10,20))

}
```

---

calc_longterm_monthly_stats

Calculate long-term summary statistics from annual monthly mean flows

---

Description

Calculates the long-term mean, median, maximum, minimum, and percentiles of annual monthly mean flow values for all months and all data (Long-term) from a daily streamflow data set. Calculates statistics from all values, unless specified. Returns a tibble with statistics.

Usage

```
calc_longterm_monthly_stats(
  data,
  dates = Date,
  values = Value,
  groups = STATION_NUMBER,
  station_number,
  percentiles = c(10, 90),
  roll_days = 1,
  roll_align = "right",
  water_year_start = 1,
  start_year,
  end_year,
  exclude_years,
  months = 1:12,
  complete_years = FALSE,
  include_annual = TRUE,
  custom_months,
  custom_months_label,
  transpose = FALSE,
  ignore_missing = FALSE
)
```

Arguments

data	Data frame of daily data that contains columns of dates, flow values, and (optional) groups (e.g. station numbers). Leave blank if using `station_number` argument.
dates	Name of column in `data` that contains dates formatted YYYY-MM-DD. Only required if dates column name is not 'Date' (default). Leave blank if using `station_number` argument.
values	Name of column in `data` that contains numeric flow values, in units of cubic metres per second. Only required if values column name is not 'Value' (default). Leave blank if using `station_number` argument.
groups	Name of column in `data` that contains unique identifiers for different data sets, if applicable. Only required if groups column name is not 'STATION_NUMBER'. Function will automatically group by a column named 'STATION_NUMBER' if present. Remove the 'STATION_NUMBER' column beforehand to remove this grouping. Leave blank if using `station_number` argument.
station_number	Character string vector of seven digit Water Survey of Canada station numbers (e.g. ″08NM116″) of which to extract daily streamflow data from a HYDAT database. Requires `tidyhydat` package and a HYDAT database. Leave blank if using `data` argument.
percentiles	Numeric vector of percentiles to calculate. Set to `NA` if none required. Default `c(10,90)`.
roll_days	Numeric value of the number of days to apply a rolling mean. Default 1.
roll_align	Character string identifying the direction of the rolling mean from the specified date, either by the first (`'left'`), last (`'right'`), or middle (`'center'`) day of the rolling n-day group of observations. Default `'right'`.
water_year_start	
	Numeric value indicating the month (1 through 12) of the start of water year for analysis. Default 1.
start_year	Numeric value of the first year to consider for analysis. Leave blank to use the first year of the source data.
end_year	Numeric value of the last year to consider for analysis. Leave blank to use the last year of the source data.
exclude_years	Numeric vector of years to exclude from analysis. Leave blank to include all years.
months	Numeric vector of months to include in analysis (e.g. `6:8` for Jun-Aug). Leave blank to summarize all months (default `1:12`).
complete_years	Logical values indicating whether to include only years with complete data in analysis. Default `FALSE`.
include_annual	Logical value indicating whether to include annual calculation of all months. Default `TRUE`.
custom_months	Numeric vector of months to combine to summarize (ex. `6:8` for Jun-Aug). Adds results to the end of table. If wanting months that overlap calendar years (ex. Oct-Mar), choose `water_year_start` that begins before the first month listed. Leave blank for no custom month summary.

custom_months_label

    Character string to label custom months. For example, if months = 7:9 you may choose "Summer" or "Jul-Sep". Default "Custom-Months".

transpose   Logical value indicating whether to transpose rows and columns of results. Default FALSE.

ignore_missing   Logical value indicating whether dates with missing values should be included in the calculation. If TRUE then a statistic will be calculated regardless of missing dates. If FALSE then only those statistics from time periods with no missing dates will be returned. Default FALSE.

Value

A tibble data frame with the following columns:

Month   month of the year, included 'Annual' for all months, and 'Custom-Months' if selected

Mean   mean of all annual monthly means for a given month over all years

Median   median of all annual monthly means for a given month over all years

Maximum   maximum of all annual monthly means for a given month over all years

Minimum   minimum of all annual monthly means for a given month over all years

P'n'   each n-th percentile selected for annual monthly means for a given month over all years

Default percentile columns:

P10   annual 10th percentile selected for annual monthly means for a given month over all years

P90   annual 90th percentile selected for annual monthly means for a given month over all years

Transposing data creates a column of "Statistics" and subsequent columns for each year selected.

Examples

```
# Run if HYDAT database has been downloaded (using tidyhydat::download_hydat())
if (file.exists(tidyhydat::hy_downloaded_db())) {

# Calculate long-term monthly statistics using data argument with defaults
flow_data <- tidyhydat::hy_daily_flows(station_number = "08NM116")
calc_longterm_monthly_stats(data = flow_data,
                            start_year = 1980)

# Calculate long-term monthly statistics using station_number argument with defaults
calc_longterm_monthly_stats(station_number = "08NM116",
                            start_year = 1980)

# Calculate long-term monthly statistics regardless if there is missing data for a given year
calc_longterm_monthly_stats(station_number = "08NM116",
                            ignore_missing = TRUE)
```

```
# Calculate long-term monthly statistics for water years starting in October
calc_longterm_monthly_stats(station_number = "08NM116",
                            start_year = 1980,
                            water_year_start = 10)

# Calculate long-term monthly statistics with custom years
calc_longterm_monthly_stats(station_number = "08NM116",
                            start_year = 1981,
                            end_year = 2010,
                            exclude_years = c(1991,1993:1995))

# Calculate long-term monthly statistics for 7-day flows for July-September months only,
# with 25 and 75th percentiles
calc_longterm_monthly_stats(station_number = "08NM116",
                            roll_days = 7,
                            months = 7:9,
                            percentiles = c(25,75),
                            ignore_missing = TRUE,
                            include_annual = FALSE) # removes the Long-term numbers

# Calculate long-term monthly statistics and add custom stats for July-September
calc_longterm_monthly_stats(station_number = "08NM116",
                            start_year = 1980,
                            custom_months = 7:9,
                            custom_months_label = "Summer")

}
```

---

calc_longterm_percentile

Calculate long-term percentiles

Description

Calculates the long-term percentiles from a daily streamflow data set. Calculates statistics from all values, unless specified. Returns a tibble with statistics.

Usage

```
calc_longterm_percentile(
  data,
  dates = Date,
  values = Value,
  groups = STATION_NUMBER,
  station_number,
  percentiles,
  roll_days = 1,
  roll_align = "right",
```

```
    water_year_start = 1,
    start_year,
    end_year,
    exclude_years,
    complete_years = FALSE,
    months = 1:12,
    transpose = FALSE
)
```

Arguments

data	Data frame of daily data that contains columns of dates, flow values, and (optional) groups (e.g. station numbers). Leave blank if using `station_number` argument.
dates	Name of column in `data` that contains dates formatted YYYY-MM-DD. Only required if dates column name is not 'Date' (default). Leave blank if using `station_number` argument.
values	Name of column in `data` that contains numeric flow values, in units of cubic metres per second. Only required if values column name is not 'Value' (default). Leave blank if using `station_number` argument.
groups	Name of column in `data` that contains unique identifiers for different data sets, if applicable. Only required if groups column name is not 'STATION_NUMBER'. Function will automatically group by a column named 'STATION_NUMBER' if present. Remove the 'STATION_NUMBER' column beforehand to remove this grouping. Leave blank if using `station_number` argument.
station_number	Character string vector of seven digit Water Survey of Canada station numbers (e.g. `"08NM116"`) of which to extract daily streamflow data from a HYDAT database. Requires `tidyhydat` package and a HYDAT database. Leave blank if using `data` argument.
percentiles	Numeric vector of percentiles (ex. `c(5,10,25,75)`) to calculate. Required.
roll_days	Numeric value of the number of days to apply a rolling mean. Default 1.
roll_align	Character string identifying the direction of the rolling mean from the specified date, either by the first (`'left'`), last (`'right'`), or middle (`'center'`) day of the rolling n-day group of observations. Default `'right'`.
water_year_start	Numeric value indicating the month (1 through 12) of the start of water year for analysis. Default 1.
start_year	Numeric value of the first year to consider for analysis. Leave blank to use the first year of the source data.
end_year	Numeric value of the last year to consider for analysis. Leave blank to use the last year of the source data.
exclude_years	Numeric vector of years to exclude from analysis. Leave blank to include all years.
complete_years	Logical values indicating whether to include only years with complete data in analysis. Default `FALSE`.

months	Numeric vector of months to include in analysis (e.g. 6:8 for Jun-Aug). Leave blank to summarize all months (default 1:12).
transpose	Logical value indicating whether to transpose rows and columns of results. Default FALSE.

Value

A tibble data frame of a long-term percentile of selected years and months.

Examples

```
# Run if HYDAT database has been downloaded (using tidyhydat::download_hydat())
if (file.exists(tidyhydat::hy_downloaded_db())) {

# Calculate the 20th percentile flow value from a flow record
calc_longterm_percentile(station_number = "08NM116",
                          percentile = 20)

# Calculate the 90th percentile flow value with custom years
calc_longterm_percentile(station_number = "08NM116",
                          start_year = 1980,
                          end_year = 2010,
                          percentile = 90)

}
```

---

calc_monthly_cumulative_stats
Calculate cumulative monthly flow statistics

Description

Calculate cumulative monthly flow statistics for each month of the year of daily flow values from a daily streamflow data set. Calculates statistics from all values from complete years, unless specified. Defaults to volumetric cumulative flows, can use use_yield and basin_area to convert to area-based water yield. Returns a tibble with statistics.

Usage

```
calc_monthly_cumulative_stats(
  data,
  dates = Date,
  values = Value,
  groups = STATION_NUMBER,
  station_number,
  percentiles = c(5, 25, 75, 95),
  use_yield = FALSE,
  basin_area,
```

```
    water_year_start = 1,
    start_year,
    end_year,
    exclude_years,
    transpose = FALSE
)
```

Arguments

data	Data frame of daily data that contains columns of dates, flow values, and (optional) groups (e.g. station numbers). Leave blank if using `station_number` argument.
dates	Name of column in `data` that contains dates formatted YYYY-MM-DD. Only required if dates column name is not 'Date' (default). Leave blank if using `station_number` argument.
values	Name of column in `data` that contains numeric flow values, in units of cubic metres per second. Only required if values column name is not 'Value' (default). Leave blank if using `station_number` argument.
groups	Name of column in `data` that contains unique identifiers for different data sets, if applicable. Only required if groups column name is not 'STATION_NUMBER'. Function will automatically group by a column named 'STATION_NUMBER' if present. Remove the 'STATION_NUMBER' column beforehand to remove this grouping. Leave blank if using `station_number` argument.
station_number	Character string vector of seven digit Water Survey of Canada station numbers (e.g. `"08NM116"`) of which to extract daily streamflow data from a HYDAT database. Requires `tidyhydat` package and a HYDAT database. Leave blank if using `data` argument.
percentiles	Numeric vector of percentiles to calculate. Set to NA if none required. Default `c(5,25,75,95)`.
use_yield	Logical value indicating whether to calculate area-based water yield, in mm, instead of volumetric discharge. Default `FALSE`.
basin_area	Upstream drainage basin area, in square kilometres, to apply to observations. Three options:
	(1) Leave blank if groups is STATION_NUMBER with HYDAT station numbers to extract basin areas from HYDAT.
	(2) A single numeric value to apply to all observations.
	(3) List each basin area for each group/station in groups (can override HYDAT value if listed) as such `c("08NM116" = 795,"08NM242" = 10)`. If group is not listed the HYDAT area will be applied if it exists, otherwise it will be NA.
water_year_start	
	Numeric value indicating the month (1 through 12) of the start of water year for analysis. Default 1.
start_year	Numeric value of the first year to consider for analysis. Leave blank to use the first year of the source data.
end_year	Numeric value of the last year to consider for analysis. Leave blank to use the last year of the source data.

exclude_years	Numeric vector of years to exclude from analysis. Leave blank to include all years.
transpose	Logical value indicating whether to transpose rows and columns of results. Default FALSE.

Value

A tibble data frame with the following columns, default units in cubic metres, or millimetres if use_yield and basin_area provided:

Month	month (MMM-DD) of cumulative statistics
Mean	monthly mean of all cumulative flows for a given month of the year
Median	monthly mean of all cumulative flows for a given month of the year
Maximum	monthly mean of all cumulative flows for a given month of the year
Minimum	monthly mean of all cumulative flows for a given month of the year
P'n'	each monthly n-th percentile selected of all cumulative flows for a given month of the year

Default percentile columns:

P5	monthly 5th percentile of all cumulative flows for a given month of the year
P25	monthly 25th percentile of all cumulative flows for a given month of the year
P75	monthly 75th percentile of all cumulative flows for a given month of the year
P95	monthly 95th percentile of all cumulative flows for a given month of the year

Transposing data creates a column of "Statistics" and subsequent columns for each year selected.

Examples

```
# Run if HYDAT database has been downloaded (using tidyhydat::download_hydat())
if (file.exists(tidyhydat::hy_downloaded_db())) {

# Calculate annual monthly cumulative volume statistics
calc_monthly_cumulative_stats(station_number = "08NM116")

# Calculate annual monthly cumulative volume statistics with default HYDAT basin area
calc_monthly_cumulative_stats(station_number = "08NM116",
                              use_yield = TRUE)

# Calculate annual monthly cumulative volume statistics with custom basin area
calc_monthly_cumulative_stats(station_number = "08NM116",
                              use_yield = TRUE,
                              basin_area = 800)

}
```

---

calc_monthly_stats   *Calculate monthly summary statistics*

Description

Calculates means, medians, maximums, minimums, and percentiles for each month of all years of flow values from a daily streamflow data set. Calculates statistics from all values, unless specified. Returns a tibble with statistics.

Usage

```
calc_monthly_stats(
  data,
  dates = Date,
  values = Value,
  groups = STATION_NUMBER,
  station_number,
  percentiles = c(10, 90),
  roll_days = 1,
  roll_align = "right",
  water_year_start = 1,
  start_year,
  end_year,
  exclude_years,
  months = 1:12,
  transpose = FALSE,
  spread = FALSE,
  ignore_missing = FALSE
)
```

Arguments

data	Data frame of daily data that contains columns of dates, flow values, and (optional) groups (e.g. station numbers). Leave blank if using `station_number` argument.
dates	Name of column in `data` that contains dates formatted YYYY-MM-DD. Only required if dates column name is not 'Date' (default). Leave blank if using `station_number` argument.
values	Name of column in `data` that contains numeric flow values, in units of cubic metres per second. Only required if values column name is not 'Value' (default). Leave blank if using `station_number` argument.
groups	Name of column in `data` that contains unique identifiers for different data sets, if applicable. Only required if groups column name is not 'STATION_NUMBER'. Function will automatically group by a column named 'STATION_NUMBER' if present. Remove the 'STATION_NUMBER' column beforehand to remove this grouping. Leave blank if using `station_number` argument.

station_number   Character string vector of seven digit Water Survey of Canada station numbers
                  (e.g. "08NM116") of which to extract daily streamflow data from a HYDAT
                  database. Requires tidyhydat package and a HYDAT database. Leave blank if
                  using data argument.

percentiles   Numeric vector of percentiles to calculate. Set to NA if none required. Default
                  c(10,90).

roll_days   Numeric value of the number of days to apply a rolling mean. Default 1.

roll_align   Character string identifying the direction of the rolling mean from the specified
                  date, either by the first ('left'), last ('right'), or middle ('center') day of
                  the rolling n-day group of observations. Default 'right'.

water_year_start
                  Numeric value indicating the month (1 through 12) of the start of water year for
                  analysis. Default 1.

start_year   Numeric value of the first year to consider for analysis. Leave blank to use the
                  first year of the source data.

end_year   Numeric value of the last year to consider for analysis. Leave blank to use the
                  last year of the source data.

exclude_years   Numeric vector of years to exclude from analysis. Leave blank to include all
                  years.

months   Numeric vector of months to include in analysis (e.g. 6:8 for Jun-Aug). Leave
                  blank to summarize all months (default 1:12).

transpose   Logical value indicating if each month statistic should be individual rows. De-
                  fault FALSE.

spread   Logical value indicating if each month statistic should be the column name.
                  Default FALSE.

ignore_missing   Logical value indicating whether dates with missing values should be included
                  in the calculation. If TRUE then a statistic will be calculated regardless of missing
                  dates. If FALSE then only those statistics from time periods with no missing dates
                  will be returned. Default FALSE.

Value

A tibble data frame with the following columns:

Year   calendar or water year selected

Month   month of the year

Mean   mean of all daily flows for a given month and year

Median   median of all daily flows for a given month and year

Maximum   maximum of all daily flows for a given month and year

Minimum   minimum of all daily flows for a given month and year

P'n'   each n-th percentile selected for a given month and year

Default percentile columns:

P10   10th percentile of all daily flows for a given month and year

P90   90th percentile of all daily flows for a given month and year

Transposing data creates a column of 'Statistics' for each month, labeled as 'Month-Statistic' (ex "Jan-Mean"), and subsequent columns for each year selected. Spreading data creates columns of Year and subsequent columns of Month-Statistics (ex 'Jan-Mean').

Examples

```
# Run if HYDAT database has been downloaded (using tidyhydat::download_hydat())
if (file.exists(tidyhydat::hy_downloaded_db())) {

# Calculate statistics using a data frame and data argument with defaults
flow_data <- tidyhydat::hy_daily_flows(station_number = "08NM116")
calc_monthly_stats(data = flow_data,
                   start_year = 1980)

# Calculate statistics using station_number argument with defaults
calc_monthly_stats(station_number = "08NM116",
                   start_year = 1980)

# Calculate statistics regardless if there is missing data for a given year
calc_monthly_stats(station_number = "08NM116",
                   ignore_missing = TRUE)

# Calculate statistics for water years starting in October
calc_monthly_stats(station_number = "08NM116",
                   start_year = 1980,
                   water_year_start = 10)

# Calculate statistics with custom years
calc_monthly_stats(station_number = "08NM116",
                   start_year = 1981,
                   end_year = 2010,
                   exclude_years = c(1991,1993:1995))

# Calculate statistics for 7-day flows, with 25 and 75th percentiles
calc_monthly_stats(station_number = "08NM116",
                   roll_days = 7,
                   percentiles = c(25,75),
                   ignore_missing = TRUE)

}
```

---

compute_annual_frequencies

Perform an annual low or high-flow frequency analysis

Description

Performs a flow volume frequency analysis on annual statistics from a daily streamflow data set. Defaults to a low flow frequency analysis using annual minimums. Set use_max = TRUE for annual high flow frequency analyses. Calculates statistics from all values, unless specified. Function will calculate using all values in 'Values' column (no grouped analysis). Analysis methodology replicates that from HEC-SSP. Returns a list of tibbles and plots.

Usage

```
compute_annual_frequencies(
  data,
  dates = Date,
  values = Value,
  station_number,
  roll_days = c(1, 3, 7, 30),
  roll_align = "right",
  use_max = FALSE,
  use_log = FALSE,
  prob_plot_position = c("weibull", "median", "hazen"),
 prob_scale_points = c(0.9999, 0.999, 0.99, 0.9, 0.5, 0.2, 0.1, 0.02, 0.01, 0.001,
    1e-04),
  fit_distr = c("PIII", "weibull"),
  fit_distr_method = ifelse(fit_distr == "PIII", "MOM", "MLE"),
  fit_quantiles = c(0.975, 0.99, 0.98, 0.95, 0.9, 0.8, 0.5, 0.2, 0.1, 0.05, 0.01),
  plot_curve = TRUE,
  water_year_start = 1,
  start_year,
  end_year,
  exclude_years,
  months = 1:12,
  ignore_missing = FALSE
)
```

Arguments

data	A data frame of daily data that contains columns of dates and flow values. Groupings and the groups argument are not used for this function (i.e. station numbers). Leave blank if using station_number argument.
dates	Name of column in data that contains dates formatted YYYY-MM-DD. Only required if dates column name is not 'Date' (default). Leave blank if using station_number argument.
values	Name of column in data that contains numeric flow values, in units of cubic metres per second. Only required if values column name is not 'Value' (default). Leave blank if using station_number argument.
station_number	Character string vector of seven digit Water Survey of Canada station numbers (e.g. "08NM116") of which to extract daily streamflow data from a HYDAT database. Requires tidyhydat package and a HYDAT database. Leave blank if using data argument.

roll_days   Numeric value of the number of days to apply a rolling mean. Default 1.

roll_align   Character string identifying the direction of the rolling mean from the specified
                   date, either by the first ('left'), last ('right'), or middle ('center') day of
                   the rolling n-day group of observations. Default 'right'.

use_max   Logical value to indicate using maximums rather than the minimums for analy-
                   sis. Default FALSE.

use_log   Logical value to indicate log-scale transforming of flow data before analysis.
                   Default FALSE.

prob_plot_position
                   Character string indicating the plotting positions used in the frequency plots, one
                   of 'weibull', 'median', or 'hazen'. Points are plotted against (i-a)/(n+1-a-b)
                   where i is the rank of the value; n is the sample size and a and b are defined
                   as: (a=0, b=0) for Weibull plotting positions; (a=.2; b=.3) for Median plotting
                   positions; and (a=.5; b=.5) for Hazen plotting positions. Default 'weibull'.

prob_scale_points
                   Numeric vector of probabilities to be plotted along the X axis in the frequency
                   plot. Inverse of return period. Default c(.9999,.999,.99,.9,.5,.2,.1,.02,.01,.001,.0001).

fit_distr   Character string identifying the distribution to fit annual data, one of 'PIII'
                   (Log Pearson Type III) or 'weibull' (Weibull) distributions. Default 'PIII'.

fit_distr_method
                   Character string identifying the method used to fit the distribution, one of 'MOM'
                   (method of moments) or 'MLE' (maximum likelihood estimation). Selected as
                   'MOM' if fit_distr ='PIII' (default) or 'MLE' if fit_distr = 'weibull'.

fit_quantiles   Numeric vector of quantiles to be estimated from the fitted distribution. Default
                   c(.975,.99,.98,.95,.90,.80,.50,.20,.10,.05,.01).

plot_curve   Logical value to indicate plotting the computed curve on the probability plot.
                   Default TRUE.

water_year_start
                   Numeric value indicating the month (1 through 12) of the start of water year for
                   analysis. Default 1.

start_year   Numeric value of the first year to consider for analysis. Leave blank to use the
                   first year of the source data.

end_year   Numeric value of the last year to consider for analysis. Leave blank to use the
                   last year of the source data.

exclude_years   Numeric vector of years to exclude from analysis. Leave blank to include all
                   years.

months   Numeric vector of months to include in analysis (e.g. 6:8 for Jun-Aug). Leave
                   blank to summarize all months (default 1:12).

ignore_missing   Logical value indicating whether dates with missing values should be included
                   in the calculation. If TRUE then a statistic will be calculated regardless of missing
                   dates. If FALSE then only those statistics from time periods with no missing dates
                   will be returned. Default FALSE.

Value

A list with the following elements:

Freq_Analysis_Data

Data frame with computed annual summary statistics used in analysis.

Freq_Plot_Data   Data frame with co-ordinates used in frequency plot.

Freq_Plot   ggplot2 object with frequency plot.

Freq_Fitting   List of fitted objects from fitdistrplus.

Freq_Fitted_Quantiles

Data frame with fitted quantiles.

compute_annual_trends   *Calculate prewhitened nonlinear annual trends on streamflow data*

Description

Calculates prewhitened nonlinear trends on annual streamflow data. Uses the zyp package to calculate trends. Review zyp for more information Calculates statistics from all values, unless specified. Returns a list of tibbles and plots. All annual statistics calculated using the calc_all_annual_stats() function which uses the following `fasstr` functions:

- calc_annual_stats()
- calc_annual_lowflows()
- calc_annual_cumulative_stats()
- calc_annual_flow_timing()
- calc_monthly_stats()
- calc_annual_outside_normal()

Usage

```
compute_annual_trends(
  data,
  dates = Date,
  values = Value,
  groups = STATION_NUMBER,
  station_number,
  zyp_method,
  basin_area,
  water_year_start = 1,
  start_year,
  end_year,
  exclude_years,
  annual_percentiles = c(10, 90),
  monthly_percentiles = c(10, 20),
  stats_days = 1,
  stats_align = "right",
  lowflow_days = c(1, 3, 7, 30),
  lowflow_align = "right",
  timing_percent = c(25, 33, 50, 75),
  normal_percentiles = c(25, 75),
  ignore_missing = FALSE,
  include_plots = TRUE,
  zyp_alpha
)
```

Arguments

data	Data frame of daily data that contains columns of dates, flow values, and (optional) groups (e.g. station numbers). Leave blank if using station_number argument.
dates	Name of column in data that contains dates formatted YYYY-MM-DD. Only required if dates column name is not 'Date' (default). Leave blank if using station_number argument.
values	Name of column in data that contains numeric flow values, in units of cubic metres per second. Only required if values column name is not 'Value' (default). Leave blank if using station_number argument.
groups	Name of column in data that contains unique identifiers for different data sets, if applicable. Only required if groups column name is not 'STATION_NUMBER'. Function will automatically group by a column named 'STATION_NUMBER' if present. Remove the 'STATION_NUMBER' column beforehand to remove this grouping. Leave blank if using station_number argument.
station_number	Character string vector of seven digit Water Survey of Canada station numbers (e.g. "08NM116") of which to extract daily streamflow data from a HYDAT database. Requires tidyhydat package and a HYDAT database. Leave blank if using data argument.
zyp_method	Character string identifying the prewhitened trend method to use from zyp, either 'zhang' or 'yuepilon'. Required.
basin_area	Upstream drainage basin area, in square kilometres, to apply to observations. Three options:
	(1) Leave blank if groups is STATION_NUMBER with HYDAT station numbers to extract basin areas from HYDAT.
	(2) A single numeric value to apply to all observations.
	(3) List each basin area for each group/station in groups (can override HYDAT value if listed) as such c("08NM116" = 795,"08NM242" = 10). If group is not listed the HYDAT area will be applied if it exists, otherwise it will be NA.
water_year_start	
	Numeric value indicating the month (1 through 12) of the start of water year for analysis. Default 1.
start_year	Numeric value of the first year to consider for analysis. Leave blank to use the first year of the source data.
end_year	Numeric value of the last year to consider for analysis. Leave blank to use the last year of the source data.
exclude_years	Numeric vector of years to exclude from analysis. Leave blank to include all years.
annual_percentiles	
	Numeric vector of percentiles to calculate annually. Set to NA if none required. Used for calc_annual_stats() function. Default c(10,90).
monthly_percentiles	
	Numeric vector of percentiles to calculate monthly for each year. Set to NA if none required. Used for calc_monthly_stats() function. Default c(10,20).

stats_days	Numeric vector of the number of days to apply a rolling mean on basic stats. Default `c(1)`. Used for `calc_annual_stats()` and `calc_monthly_stats()` functions.
stats_align	Character string identifying the direction of the rolling mean on basic stats from the specified date, either by the first (`'left'`), last (`'right'`), or middle (`'center'`) day of the rolling n-day group of observations. Default `'right'`. Used for `calc_annual_stats()`, `calc_monthly_stats()`, and `calc_annual_outside_normal()` functions.
lowflow_days	Numeric vector of the number of days to apply a rolling mean on low flow stats. Default `c(1,3,7,30)`. Used for `calc_lowflow_stats()` function.
lowflow_align	Character string identifying the direction of the rolling mean on low flow stats from the specified date, either by the first (`'left'`), last (`'right'`), or middle (`'center'`) day of the rolling n-day group of observations. Default `'right'`. Used for `calc_lowflow_stats()` function.
timing_percent	Numeric vector of percents of annual total flows to determine dates. Used for `calc_annual_flow_timing()` function. Default `c(25,33.3,50,75)`.
normal_percentiles	
	Numeric vector of two values, lower and upper percentiles, respectively indicating the limits of the normal range. Default `c(25,75)`.
ignore_missing	Logical value indicating whether dates with missing values should be included in the calculation. If `TRUE` then a statistic will be calculated regardless of missing dates. If `FALSE` then only those statistics from time periods with no missing dates will be returned. Default `FALSE`.
include_plots	Logical value indicating if annual trending plots should be included. Default `TRUE`.
zyp_alpha	Numeric value of the significance level (ex. `0.05`) of when to plot a trend line. Leave blank for no line.

Value

A list of tibbles and optional plots from the trending analysis including:

Annual_Trends_Data	
	a tibble of the annual statistics used for trending
Annual_Trends_Results	
	a tibble of the results of the zyp trending analysis
Annual_*	each ggplot2 object for each annual trended statistic

compute_frequency_analysis

Perform a custom volume frequency analysis

Description

Performs a volume frequency analysis on custom data. Defaults to ranking by minimums; use use_max for to rank by maximum flows. Calculates the statistics from events and flow values provided. Columns of events (e.g. years), their values (minimums or maximums), and identifiers (low-flows, high-flows, etc.). Function will calculate using all values in the provided data (no grouped analysis). Analysis methodology replicates that from HEC-SSP. Returns a list of tibbles and plots.

Usage

```
compute_frequency_analysis(
  data,
  events = Year,
  values = Value,
  measures = Measure,
  use_max = FALSE,
  use_log = FALSE,
  prob_plot_position = c("weibull", "median", "hazen"),
  prob_scale_points = c(0.9999, 0.999, 0.99, 0.9, 0.5, 0.2, 0.1, 0.02, 0.01, 0.001,
    1e-04),
  fit_distr = c("PIII", "weibull"),
  fit_distr_method = ifelse(fit_distr == "PIII", "MOM", "MLE"),
  fit_quantiles = c(0.975, 0.99, 0.98, 0.95, 0.9, 0.8, 0.5, 0.2, 0.1, 0.05, 0.01),
  plot_curve = TRUE
)
```

Arguments

`data`	A data frame of data that contains columns of events, flow values, and measures (data type).
`events`	Column in `data` that contains event identifiers, typically year values. Default `'Year'`.
`values`	Column in `data` that contains numeric flow values, in units of cubic metres per second. Default `'Value'`.
`measures`	Column in `data` that contains measure identifiers (example data: '7-day low' or 'Annual Max'). Can have multiple measures (ex. '7-day low' and '30-day low') in column if multiple statistics are desired. Default `'Measure'`.
`use_max`	Logical value to indicate using maximums rather than the minimums for analysis. Default `FALSE`.
`use_log`	Logical value to indicate log-scale transforming of flow data before analysis. Default `FALSE`.
`prob_plot_position`	
	Character string indicating the plotting positions used in the frequency plots, one of `'weibull'`, `'median'`, or `'hazen'`. Points are plotted against (i-a)/(n+1-a-b) where i is the rank of the value; n is the sample size and a and b are defined as: (a=0, b=0) for Weibull plotting positions; (a=.2; b=.3) for Median plotting positions; and (a=.5; b=.5) for Hazen plotting positions. Default `'weibull'`.
`prob_scale_points`	
	Numeric vector of probabilities to be plotted along the X axis in the frequency plot. Inverse of return period. Default `c(.9999,.999,.99,.9,.5,.2,.1,.02,.01,.001,.0001)`.
`fit_distr`	Character string identifying the distribution to fit annual data, one of `'PIII'` (Log Pearson Type III) or `'weibull'` (Weibull) distributions. Default `'PIII'`.
`fit_distr_method`	
	Character string identifying the method used to fit the distribution, one of `'MOM'` (method of moments) or `'MLE'` (maximum likelihood estimation). Selected as `'MOM'` if `fit_distr` =`'PIII'` (default) or `'MLE'` if `fit_distr` = `'weibull'`.

fit_quantiles   Numeric vector of quantiles to be estimated from the fitted distribution. Default
                 c(.975,.99,.98,.95,.90,.80,.50,.20,.10,.05,.01).

plot_curve   Logical value to indicate plotting the computed curve on the probability plot.
                 Default TRUE.

Value

A list with the following elements:

Freq_Analysis_Data
                 Data frame with computed annual summary statistics used in analysis.

Freq_Plot_Data Data frame with co-ordinates used in frequency plot.

Freq_Plot   ggplot2 object with frequency plot

Freq_Fitting   List of fitted objects from fitdistrplus.

Freq_Fitted_Quantiles
                 Data frame with fitted quantiles.

Examples

```
## Not run:

 # Working example:

# Calculate some values to use for a frequency analysis
# (requires years, values for those years, and the name of the measure/metric)
low_flows <- calc_annual_lowflows(station_number = "08NM116",
                                  start_year = 1980,
                                  end_year = 2000,
                                  roll_days = 7)
low_flows <- dplyr::select(low_flows, Year, Value = Min_7_Day)
low_flows <- dplyr::mutate(low_flows, Measure = "7-Day")

# Compute the frequency analysis using the default parameters
results <- compute_frequency_analysis(data = low_flows,
                                      events = Year,
                                      values = Value,
                                      measure = Measure)

## End(Not run)
```

---

compute_frequency_quantile
                    Calculate an annual frequency analysis quantile

---

Description

Performs a volume frequency analysis on annual statistics from a daily streamflow data set and calculates a statistic based on the provided mean n-days and return period of the statistic, defaults to minimum flows. For example, to determine the 7Q10 of a data set, set the `roll_days` to 7 and the `return_period` to 10. Function will calculate using all values in 'Values' column (no grouped analysis), unless specified. Analysis methodology replicates that from HEC-SSP. Returns a tibble with statistics.

Usage

```
compute_frequency_quantile(
  data,
  dates = Date,
  values = Value,
  station_number,
  roll_days = NA,
  roll_align = "right",
  return_period = NA,
  use_max = FALSE,
  use_log = FALSE,
  fit_distr = c("PIII", "weibull"),
  fit_distr_method = ifelse(fit_distr == "PIII", "MOM", "MLE"),
  water_year_start = 1,
  start_year,
  end_year,
  exclude_years,
  months = 1:12,
  ignore_missing = FALSE
)
```

Arguments

data	A data frame of data that contains columns of events, flow values, and measures (data type).
dates	Name of column in `data` that contains dates formatted YYYY-MM-DD. Only required if dates column name is not 'Date' (default). Leave blank if using `station_number` argument.
values	Column in `data` that contains numeric flow values, in units of cubic metres per second. Default `'Value'`.
station_number	Character string vector of seven digit Water Survey of Canada station numbers (e.g. `"08NM116"`) of which to extract daily streamflow data from a HYDAT database. Requires `tidyhydat` package and a HYDAT database. Leave blank if using `data` argument.
roll_days	Numeric value of the number of days to apply a rolling mean. Required.
roll_align	Character string identifying the direction of the rolling mean from the specified date, either by the first (`'left'`), last (`'right'`), or middle (`'center'`) day of the rolling n-day group of observations. Default `'right'`.

return_period	Numeric vector of the estimated time interval, in years, between flow events of a similar size, inverse of probability, used to estimate the frequency statistic. Required.
use_max	Logical value to indicate using maximums rather than the minimums for analysis. Default FALSE.
use_log	Logical value to indicate log-scale transforming of flow data before analysis. Default FALSE.
fit_distr	Character string identifying the distribution to fit annual data, one of 'PIII' (Log Pearson Type III) or 'weibull' (Weibull) distributions. Default 'PIII'.
fit_distr_method	
	Character string identifying the method used to fit the distribution, one of 'MOM' (method of moments) or 'MLE' (maximum likelihood estimation). Selected as 'MOM' if fit_distr ='PIII' (default) or 'MLE' if fit_distr = 'weibull'.
water_year_start	
	Numeric value indicating the month (1 through 12) of the start of water year for analysis. Default 1.
start_year	Numeric value of the first year to consider for analysis. Leave blank to use the first year of the source data.
end_year	Numeric value of the last year to consider for analysis. Leave blank to use the last year of the source data.
exclude_years	Numeric vector of years to exclude from analysis. Leave blank to include all years.
months	Numeric vector of months to include in analysis (e.g. 6:8 for Jun-Aug). Leave blank to summarize all months (default 1:12).
ignore_missing	Logical value indicating whether dates with missing values should be included in the calculation. If TRUE then a statistic will be calculated regardless of missing dates. If FALSE then only those statistics from time periods with no missing dates will be returned. Default FALSE.

Value

A numeric value of the frequency analysis quantile, given the roll_days and return_period.

compute_full_analysis   *Compute a suite of tables and plots from various fasstr functions*

Description

Calculates tables and plots from a suite of statistics from `fasstr` functions. Calculates statistics from all values, unless specified.The statistics are grouped into 7 analysis groups (see `analyses` argument) which are stored in lists in the object. Due to the number of tables and plots to be made, this function may take several minutes to complete. If `ignore_missing = FALSE` (default) and there is missing data, some tables and plots may be empty and produce warnings. Use `ignore_missing = TRUE` to ignore the missing values or filter your data to complete years. Returns a list of tibbles and plots.

Usage

```
compute_full_analysis(
  data,
  dates = Date,
  values = Value,
  groups = STATION_NUMBER,
  station_number,
  analyses = 1:7,
  basin_area,
  water_year_start = 1,
  start_year,
  end_year,
  exclude_years,
  ignore_missing = FALSE,
  zyp_method = "yuepilon",
  zyp_alpha
)
```

Arguments

data	Data frame of daily data that contains columns of dates, flow values, and (optional) groups (e.g. station numbers). Leave blank if using `station_number` argument.
dates	Name of column in `data` that contains dates formatted YYYY-MM-DD. Only required if dates column name is not 'Date' (default). Leave blank if using `station_number` argument.
values	Name of column in `data` that contains numeric flow values, in units of cubic metres per second. Only required if values column name is not 'Value' (default). Leave blank if using `station_number` argument.

groups   Name of column in data that contains unique identifiers for different data sets, if
                        applicable. Only required if groups column name is not 'STATION_NUMBER'.
                        Function will automatically group by a column named 'STATION_NUMBER'
                        if present. Remove the 'STATION_NUMBER' column beforehand to remove
                        this grouping. Leave blank if using station_number argument.

station_number   Character string vector of seven digit Water Survey of Canada station numbers
                        (e.g. "08NM116") of which to extract daily streamflow data from a HYDAT
                        database. Requires tidyhydat package and a HYDAT database. Leave blank if
                        using data argument.

analyses   Numeric vector of analyses to run (default is all (1:7)):

                            • 1: Screening
                            • 2: Long-term
                            • 3: Annual
                            • 4: Monthly
                            • 5: Daily
                            • 6: Annual Trends
                            • 7: Low-flow Frequencies

basin_area   Upstream drainage basin area, in square kilometres, to apply to observations.
                        Three options:

                        (1) Leave blank if groups is STATION_NUMBER with HYDAT station num-
                        bers to extract basin areas from HYDAT.

                        (2) A single numeric value to apply to all observations.

                        (3) List each basin area for each group/station in groups (can override HYDAT
                        value if listed) as such c("08NM116" = 795,"08NM242" = 10). If group is not
                        listed the HYDAT area will be applied if it exists, otherwise it will be NA.

water_year_start
                        Numeric value indicating the month (1 through 12) of the start of water year for
                        analysis. Default 1.

start_year   Numeric value of the first year to consider for analysis. Leave blank to use the
                        first year of the source data.

end_year   Numeric value of the last year to consider for analysis. Leave blank to use the
                        last year of the source data.

exclude_years   Numeric vector of years to exclude from analysis. Leave blank to include all
                        years.

ignore_missing   Logical value indicating whether dates with missing values should be included
                        in the calculation. If TRUE then a statistic will be calculated regardless of missing
                        dates. If FALSE then only those statistics from time periods with no missing dates
                        will be returned. Default FALSE.

zyp_method   Character string identifying the prewhitened trend method to use from 'zyp',
                        either 'zhang' or 'yuepilon'. Only required if analysis group 6 is included.
                        Default 'yuepilon'.

zyp_alpha   Numeric value of the significance level (ex. 0.05) of when to plot a trend line.
                        Leave blank for no line.

Value

A list of lists of tibble data frames and ggplot2 objects from various fasstr functions organized by the analysis groups as listed above.

---

compute_hydat_peak_frequencies
Perform a frequency analysis on annual peak statistics from HYDAT

Description

Performs a volume frequency analysis on annual peak statistics (instantaneous minimums or maximums) extracted from HYDAT. Calculates statistics from all years, unless specified. The data argument is not available. Analysis methodology replicates that from HEC-SSP. Returns a list of tibbles and plots.

Usage

```
compute_hydat_peak_frequencies(
  station_number,
  use_max = FALSE,
  use_log = FALSE,
  prob_plot_position = c("weibull", "median", "hazen"),
  prob_scale_points = c(0.9999, 0.999, 0.99, 0.9, 0.5, 0.2, 0.1, 0.02, 0.01, 0.001,
    1e-04),
  fit_distr = c("PIII", "weibull"),
  fit_distr_method = ifelse(fit_distr == "PIII", "MOM", "MLE"),
  fit_quantiles = c(0.975, 0.99, 0.98, 0.95, 0.9, 0.8, 0.5, 0.2, 0.1, 0.05, 0.01),
  start_year,
  end_year,
  exclude_years,
  plot_curve = TRUE
)
```

Arguments

station_number   A character string vector of seven digit Water Survey of Canada station num-
                  bers (e.g. "08NM116") of which to extract annual peak minimum or maximum
                  instantaneous streamflow data from a HYDAT database. Requires tidyhydat
                  package and a HYDAT database.

use_max   Logical value to indicate using maximums rather than the minimums for analy-
                  sis. Default FALSE.

use_log   Logical value to indicate log-scale transforming of flow data before analysis.
                  Default FALSE.

prob_plot_position
                  Character string indicating the plotting positions used in the frequency plots, one
                  of 'weibull', 'median', or 'hazen'. Points are plotted against (i-a)/(n+1-a-b)
                  where i is the rank of the value; n is the sample size and a and b are defined
                  as: (a=0, b=0) for Weibull plotting positions; (a=.2; b=.3) for Median plotting
                  positions; and (a=.5; b=.5) for Hazen plotting positions. Default 'weibull'.

prob_scale_points
                  Numeric vector of probabilities to be plotted along the X axis in the frequency
                  plot. Inverse of return period. Default c(.9999,.999,.99,.9,.5,.2,.1,.02,.01,.001,.0001).

fit_distr   Character string identifying the distribution to fit annual data, one of 'PIII'
                  (Log Pearson Type III) or 'weibull' (Weibull) distributions. Default 'PIII'.

fit_distr_method
                  Character string identifying the method used to fit the distribution, one of 'MOM'
                  (method of moments) or 'MLE' (maximum likelihood estimation). Selected as
                  'MOM' if fit_distr ='PIII' (default) or 'MLE' if fit_distr = 'weibull'.

fit_quantiles   Numeric vector of quantiles to be estimated from the fitted distribution. Default
                  c(.975,.99,.98,.95,.90,.80,.50,.20,.10,.05,.01).

start_year   Numeric value of the first year to consider for analysis. Leave blank to use the
                  first year of the source data.

end_year	Numeric value of the last year to consider for analysis. Leave blank to use the last year of the source data.
exclude_years	Numeric vector of years to exclude from analysis. Leave blank to include all years.
plot_curve	Logical value to indicate plotting the computed curve on the probability plot. Default TRUE.

Value

A list with the following elements:

Freq_Analysis_Data

Data frame with computed annual summary statistics used in analysis.

Freq_Plot_Data Data frame with co-ordinates used in frequency plot.

Freq_Plot ggplot2 object with frequency plot

Freq_Fitting List of fitted objects from fitdistrplus.

Freq_Fitted_Quantiles

Data frame with fitted quantiles.

fill_missing_dates   *Add rows of missing dates and fill missing flow values with NA*

Description

Adds rows of dates with missing flow values to a streamflow data set with daily flow values of NA. Missing dates will be filled in gaps between data and completely fill the first and last years.

Usage

```
fill_missing_dates(
  data,
  dates = Date,
  values = Value,
  groups = STATION_NUMBER,
  station_number,
  water_year_start = 1,
  fill_end_years = TRUE
)
```

Arguments

data	Data frame of daily data that contains columns of dates, flow values, and (optional) groups (e.g. station numbers). Leave blank if using station_number argument.
dates	Name of column in data that contains dates formatted YYYY-MM-DD. Only required if dates column name is not 'Date' (default). Leave blank if using station_number argument.
values	Name of column in data that contains numeric flow values, in units of cubic metres per second. Only required if values column name is not 'Value' (default). Leave blank if using station_number argument.
groups	Name of column in data that contains unique identifiers for different data sets, if applicable. Only required if groups column name is not 'STATION_NUMBER'. Function will automatically group by a column named 'STATION_NUMBER' if present. Remove the 'STATION_NUMBER' column beforehand to remove this grouping. Leave blank if using station_number argument.
station_number	Character string vector of seven digit Water Survey of Canada station numbers (e.g. "08NM116") of which to extract daily streamflow data from a HYDAT database. Requires tidyhydat package and a HYDAT database. Leave blank if using data argument.
water_year_start	Numeric value indicating the month (1 through 12) of the start of water year for analysis. Default 1.
fill_end_years	Logical value indicating whether to fill incomplete start and end years with rows of dates with NA flow values. If FALSE then only missing dates between the provided start and end dates will be filled. Default TRUE.

Value

A tibble data frame of the source data with additional rows of filled values of missing dates.

Examples

```
# Run if HYDAT database has been downloaded (using tidyhydat::download_hydat())
if (file.exists(tidyhydat::hy_downloaded_db())) {

# Fill missing dates with NA using calendar years
fill_missing_dates(station_number = "08NM116")

# Fill missing dates with NA using water years starting in August
fill_missing_dates(station_number = "08NM116",
                   water_year_start = 8)

}
```

```
plot_annual_cumulative_stats
```
Plot annual (and seasonal) cumulative flows

Description

Plots annual and seasonal (if include_seaons = TRUE) total flows, volumetric discharge or water yields, from a daily streamflow data set. Calculates statistics from all values, unless specified. Data calculated from plot_annual_cumulative_stats() function. For water year and seasonal data, the designated year is the year in which the year or season ends. Returns a list of plots.

Usage

```
plot_annual_cumulative_stats(
  data,
  dates = Date,
  values = Value,
  groups = STATION_NUMBER,
  station_number,
  use_yield = FALSE,
  basin_area,
  water_year_start = 1,
  start_year,
  end_year,
  exclude_years,
  include_seasons = FALSE,
  log_discharge = FALSE,
  include_title = FALSE
)
```

Arguments

data	Data frame of daily data that contains columns of dates, flow values, and (optional) groups (e.g. station numbers). Leave blank if using `station_number` argument.
dates	Name of column in `data` that contains dates formatted YYYY-MM-DD. Only required if dates column name is not 'Date' (default). Leave blank if using `station_number` argument.
values	Name of column in `data` that contains numeric flow values, in units of cubic metres per second. Only required if values column name is not 'Value' (default). Leave blank if using `station_number` argument.
groups	Name of column in `data` that contains unique identifiers for different data sets, if applicable. Only required if groups column name is not 'STATION_NUMBER'. Function will automatically group by a column named 'STATION_NUMBER' if present. Remove the 'STATION_NUMBER' column beforehand to remove this grouping. Leave blank if using `station_number` argument.
station_number	Character string vector of seven digit Water Survey of Canada station numbers (e.g. `"08NM116"`) of which to extract daily streamflow data from a HYDAT database. Requires `tidyhydat` package and a HYDAT database. Leave blank if using `data` argument.
use_yield	Logical value indicating whether to calculate area-based water yield, in mm, instead of volumetric discharge. Default `FALSE`.
basin_area	Upstream drainage basin area, in square kilometres, to apply to observations. Three options: (1) Leave blank if `groups` is STATION_NUMBER with HYDAT station numbers to extract basin areas from HYDAT. (2) A single numeric value to apply to all observations. (3) List each basin area for each group/station in groups (can override HYDAT value if listed) as such `c("08NM116" = 795,"08NM242" = 10)`. If group is not listed the HYDAT area will be applied if it exists, otherwise it will be `NA`.
water_year_start	Numeric value indicating the month (1 through 12) of the start of water year for analysis. Default 1.
start_year	Numeric value of the first year to consider for analysis. Leave blank to use the first year of the source data.
end_year	Numeric value of the last year to consider for analysis. Leave blank to use the last year of the source data.
exclude_years	Numeric vector of years to exclude from analysis. Leave blank to include all years.
include_seasons	Logical value indication whether to include seasonal yields or volumetric discharges. Default `TRUE`.
log_discharge	Logical value to indicate plotting the discharge axis (Y-axis) on a logarithmic scale. Default `FALSE`.
include_title	Logical value to indicate adding the group/station number to the plot, if provided. Default `FALSE`.

Value

A list of ggplot2 objects with the following for each station provided:

Annual_Total_Volume
      annual total volumetric discharge, in cubic metres

Two_Seasons_Total_Volume
      if include_seasons = TRUE, two seasons total volumetric discharges, in cubic
      metres

Four_Seasons_Total_Volume
      if include_seasons = TRUE, four seasons total volumetric discharges, in cubic
      metres

If use_yield argument is used the list will contain the following objects:

Annual_Yield   annual water yield, in millimetres

Two_Seasons_Yield
      if include_seasons = TRUE, two seasons water yield, in millimetres

Four_Seasons_Yield
      if include_seasons = TRUE, four seasons water yield, in millimetres

                             include_seasons = TRUE)

}
```

---

plot_annual_flow_timing
Plot annual timing of flows

Description

Plots the timing (day of year and date) of portions of total annual flow of daily flow values from a daily streamflow data set. Calculates statistics from all values from complete years, unless specified. Data calculated using `calc_annual_flow_timing()` function. Returns a list of plots.

Usage

```
plot_annual_flow_timing(
  data,
  dates = Date,
  values = Value,
  groups = STATION_NUMBER,
  station_number,
  percent_total = c(25, 33.3, 50, 75),
  water_year_start = 1,
  start_year,
  end_year,
  exclude_years,
  include_title = FALSE
)
```

Arguments

data	Data frame of daily data that contains columns of dates, flow values, and (optional) groups (e.g. station numbers). Leave blank if using `station_number` argument.
dates	Name of column in `data` that contains dates formatted YYYY-MM-DD. Only required if dates column name is not 'Date' (default). Leave blank if using `station_number` argument.
values	Name of column in `data` that contains numeric flow values, in units of cubic metres per second. Only required if values column name is not 'Value' (default). Leave blank if using `station_number` argument.
groups	Name of column in `data` that contains unique identifiers for different data sets, if applicable. Only required if groups column name is not 'STATION_NUMBER'. Function will automatically group by a column named 'STATION_NUMBER' if present. Remove the 'STATION_NUMBER' column beforehand to remove this grouping. Leave blank if using `station_number` argument.
station_number	Character string vector of seven digit Water Survey of Canada station numbers (e.g. `"08NM116"`) of which to extract daily streamflow data from a HYDAT database. Requires `tidyhydat` package and a HYDAT database. Leave blank if using `data` argument.

percent_total	Numeric vector of percents of total annual flows to determine dates. Default `c(25,33.3,50,75)`.
water_year_start	
	Numeric value indicating the month (1 through 12) of the start of water year for analysis. Default 1.
start_year	Numeric value of the first year to consider for analysis. Leave blank to use the first year of the source data.
end_year	Numeric value of the last year to consider for analysis. Leave blank to use the last year of the source data.
exclude_years	Numeric vector of years to exclude from analysis. Leave blank to include all years.
include_title	Logical value to indicate adding the group/station number to the plot, if provided. Default `FALSE`.

Value

A list of ggplot2 objects with the following for each station provided:

Annual_Flow_Timing

> a plot that contains each n-percent of total volumetric discharge

Default plots on each object:

DoY_25pct_TotalQ

> day of year of 25-percent of total volumetric discharge

DoY_33.3pct_TotalQ

> day of year of 33.3-percent of total volumetric discharge

DoY_50pct_TotalQ

> day of year of 50-percent of total volumetric discharge

DoY_75pct_TotalQ

> day of year of 75-percent of total volumetric discharge

plot_annual_lowflows   *Plot annual low flows and dates*

Description

Plot annual n-day minimum values, and the day of year and date of occurrence of daily flow values from a daily streamflow data set. Calculates statistics from all values, unless specified. Data calculated from calc_annual_lowflows() function. Returns a list of plots.

Usage

```
plot_annual_lowflows(
  data,
  dates = Date,
  values = Value,
  groups = STATION_NUMBER,
  station_number,
  roll_days = c(1, 3, 7, 30),
  roll_align = "right",
  water_year_start = 1,
  start_year,
  end_year,
  exclude_years,
  months = 1:12,
  ignore_missing = FALSE,
  log_discharge = FALSE,
  include_title = FALSE
)
```

Arguments

data	Data frame of daily data that contains columns of dates, flow values, and (optional) groups (e.g. station numbers). Leave blank if using station_number argument.
dates	Name of column in data that contains dates formatted YYYY-MM-DD. Only required if dates column name is not 'Date' (default). Leave blank if using station_number argument.
values	Name of column in data that contains numeric flow values, in units of cubic metres per second. Only required if values column name is not 'Value' (default). Leave blank if using station_number argument.

groups	Name of column in data that contains unique identifiers for different data sets, if applicable. Only required if groups column name is not 'STATION_NUMBER'. Function will automatically group by a column named 'STATION_NUMBER' if present. Remove the 'STATION_NUMBER' column beforehand to remove this grouping. Leave blank if using station_number argument.
station_number	Character string vector of seven digit Water Survey of Canada station numbers (e.g. "08NM116") of which to extract daily streamflow data from a HYDAT database. Requires tidyhydat package and a HYDAT database. Leave blank if using data argument.
roll_days	Numeric value of the number of days to apply a rolling mean. Default 1.
roll_align	Character string identifying the direction of the rolling mean from the specified date, either by the first ('left'), last ('right'), or middle ('center') day of the rolling n-day group of observations. Default 'right'.
water_year_start	
	Numeric value indicating the month (1 through 12) of the start of water year for analysis. Default 1.
start_year	Numeric value of the first year to consider for analysis. Leave blank to use the first year of the source data.
end_year	Numeric value of the last year to consider for analysis. Leave blank to use the last year of the source data.
exclude_years	Numeric vector of years to exclude from analysis. Leave blank to include all years.
months	Numeric vector of months to include in analysis (e.g. 6:8 for Jun-Aug). Leave blank to summarize all months (default 1:12).
ignore_missing	Logical value indicating whether dates with missing values should be included in the calculation. If TRUE then a statistic will be calculated regardless of missing dates. If FALSE then only those statistics from time periods with no missing dates will be returned. Default FALSE.
log_discharge	Logical value to indicate plotting the discharge axis (Y-axis) on a logarithmic scale. Default FALSE.
include_title	Logical value to indicate adding the group/station number to the plot, if provided. Default FALSE.

Value

A list of ggplot2 objects with the following for each station provided:

Annual_Minimums

ggplot2 object of annual minimums of selected n-day rolling means

Annual_Minimums_Days

ggplot2 object of the day of years of annual minimums of selected n-day rolling means

See Also

calc_annual_lowflows

Examples

```
# Run if HYDAT database has been downloaded (using tidyhydat::download_hydat())
if (file.exists(tidyhydat::hy_downloaded_db())) {

# Plot annual 1, 3, 7, and 30-day (default) low flow statistics with default alignment
plot_annual_lowflows(station_number = "08NM116")

# Plot annual custom 3 and 7-day low flow statistics with "center" alignment
plot_annual_lowflows(station_number = "08NM116",
                     roll_days = c(3,7),
                     roll_align = "center")

}
```

---

plot_annual_means   *Plot annual means compared to the long-term mean*

Description

Plot annual means using the long-term annual mean as the point of reference for annual means. Calculates statistics from all values, unless specified. Data calculated using calc_annual_stats() function. Returns a list of plots.

Usage

```
plot_annual_means(
  data,
  dates = Date,
  values = Value,
  groups = STATION_NUMBER,
  station_number,
  roll_days = 1,
  roll_align = "right",
  water_year_start = 1,
  start_year,
  end_year,
  exclude_years,
  months = 1:12,
  ignore_missing = FALSE,
  include_title = FALSE
)
```

Arguments

data   Data frame of daily data that contains columns of dates, flow values, and (optional) groups (e.g. station numbers). Leave blank if using station_number argument.

dates	Name of column in data that contains dates formatted YYYY-MM-DD. Only required if dates column name is not 'Date' (default). Leave blank if using `station_number` argument.
values	Name of column in data that contains numeric flow values, in units of cubic metres per second. Only required if values column name is not 'Value' (default). Leave blank if using `station_number` argument.
groups	Name of column in data that contains unique identifiers for different data sets, if applicable. Only required if groups column name is not 'STATION_NUMBER'. Function will automatically group by a column named 'STATION_NUMBER' if present. Remove the 'STATION_NUMBER' column beforehand to remove this grouping. Leave blank if using `station_number` argument.
station_number	Character string vector of seven digit Water Survey of Canada station numbers (e.g. `"08NM116"`) of which to extract daily streamflow data from a HYDAT database. Requires `tidyhydat` package and a HYDAT database. Leave blank if using data argument.
roll_days	Numeric value of the number of days to apply a rolling mean. Default 1.
roll_align	Character string identifying the direction of the rolling mean from the specified date, either by the first (`'left'`), last (`'right'`), or middle (`'center'`) day of the rolling n-day group of observations. Default `'right'`.
water_year_start	
	Numeric value indicating the month (1 through 12) of the start of water year for analysis. Default 1.
start_year	Numeric value of the first year to consider for analysis. Leave blank to use the first year of the source data.
end_year	Numeric value of the last year to consider for analysis. Leave blank to use the last year of the source data.
exclude_years	Numeric vector of years to exclude from analysis. Leave blank to include all years.
months	Numeric vector of months to include in analysis (e.g. `6:8` for Jun-Aug). Leave blank to summarize all months (default `1:12`).
ignore_missing	Logical value indicating whether dates with missing values should be included in the calculation. If `TRUE` then a statistic will be calculated regardless of missing dates. If `FALSE` then only those statistics from time periods with no missing dates will be returned. Default `FALSE`.
include_title	Logical value to indicate adding the group/station number to the plot, if provided. Default `FALSE`.

Value

A list of ggplot2 objects for with the following plots for each station provided:

Annual_Means	a plot that contains annual means with the long-term mean as the x-axis intercept

See Also

[calc_annual_stats](#)

Examples

```
# Run if HYDAT database has been downloaded (using tidyhydat::download_hydat())
if (file.exists(tidyhydat::hy_downloaded_db())) {

# Plot annual means
plot_annual_means(station_number = "08NM116")

# Plot mean flows from July-September
plot_annual_means(station_number = "08NM116",
                  months = 7:9)

}
```

```
plot_annual_outside_normal
```
                    Plot annual days above and below normal

Description

Plots the number of days per year outside of the 'normal' range (typically between 25 and 75th percentiles) for each day of the year. Upper and lower-range percentiles are calculated for each day of the year of from all years, and then each daily flow value for each year is compared. All days above or below the normal range are included. Calculates statistics from all values from complete years, unless specified. Data calculated using `calc_annual_outside_normal()` function. Returns a list of plots.

Usage

```
plot_annual_outside_normal(
  data,
  dates = Date,
  values = Value,
  groups = STATION_NUMBER,
  station_number,
  normal_percentiles = c(25, 75),
  roll_days = 1,
  roll_align = "right",
  water_year_start = 1,
  start_year,
  end_year,
  exclude_years,
  months = 1:12,
  include_title = FALSE
)
```

Arguments

data	Data frame of daily data that contains columns of dates, flow values, and (optional) groups (e.g. station numbers). Leave blank if using station_number argument.
dates	Name of column in data that contains dates formatted YYYY-MM-DD. Only required if dates column name is not 'Date' (default). Leave blank if using station_number argument.
values	Name of column in data that contains numeric flow values, in units of cubic metres per second. Only required if values column name is not 'Value' (default). Leave blank if using station_number argument.
groups	Name of column in data that contains unique identifiers for different data sets, if applicable. Only required if groups column name is not 'STATION_NUMBER'. Function will automatically group by a column named 'STATION_NUMBER' if present. Remove the 'STATION_NUMBER' column beforehand to remove this grouping. Leave blank if using station_number argument.
station_number	Character string vector of seven digit Water Survey of Canada station numbers (e.g. "08NM116") of which to extract daily streamflow data from a HYDAT database. Requires tidyhydat package and a HYDAT database. Leave blank if using data argument.
normal_percentiles	
	Numeric vector of two values, lower and upper percentiles, respectively indicating the limits of the normal range. Default c(25,75).
roll_days	Numeric value of the number of days to apply a rolling mean. Default 1.
roll_align	Character string identifying the direction of the rolling mean from the specified date, either by the first ('left'), last ('right'), or middle ('center') day of the rolling n-day group of observations. Default 'right'.
water_year_start	
	Numeric value indicating the month (1 through 12) of the start of water year for analysis. Default 1.
start_year	Numeric value of the first year to consider for analysis. Leave blank to use the first year of the source data.
end_year	Numeric value of the last year to consider for analysis. Leave blank to use the last year of the source data.
exclude_years	Numeric vector of years to exclude from analysis. Leave blank to include all years.
months	Numeric vector of months to include in analysis (e.g. 6:8 for Jun-Aug). Leave blank to summarize all months (default 1:12).
include_title	Logical value to indicate adding the group/station number to the plot, if provided. Default FALSE.

Value

A list of ggplot2 objects with the following for each station provided:

Annual_Days_Outside_Normal
                a plot that contains the number of days outside normal

Default plots on each object:

Days_Below_Normal

number of days per year below the daily normal (default 25th percentile)

Days_Above_Normal

number of days per year above the daily normal (default 75th percentile)

Days_Outside_Normal

number of days per year below and above the daily normal (default 25/75th percentile)

See Also

calc_annual_outside_normal

Examples

```
# Run if HYDAT database has been downloaded (using tidyhydat::download_hydat())
if (file.exists(tidyhydat::hy_downloaded_db())) {

# Plot annual statistics with default limits of normal (25 and 75th percentiles)
plot_annual_outside_normal(station_number = "08NM116")

# Plot annual statistics with custom limits of normal
plot_annual_outside_normal(station_number = "08NM116",
                           normal_percentiles = c(10,90))

}
```

---

plot_annual_stats   *Plot annual summary statistics*

Description

Plots means, medians, maximums, minimums, and percentiles for each year from all years of a daily streamflow data set. Calculates statistics from all values, unless specified. Data calculated using calc_annual_stats() function. Returns a list of plots.

Usage

```
plot_annual_stats(
  data,
  dates = Date,
  values = Value,
  groups = STATION_NUMBER,
  station_number,
  percentiles,
  roll_days = 1,
  roll_align = "right",
```

```
    water_year_start = 1,
    start_year,
    end_year,
    exclude_years,
    months = 1:12,
    ignore_missing = FALSE,
    log_discharge = FALSE,
    include_title = FALSE
)
```

Arguments

data	Data frame of daily data that contains columns of dates, flow values, and (optional) groups (e.g. station numbers). Leave blank if using station_number argument.
dates	Name of column in data that contains dates formatted YYYY-MM-DD. Only required if dates column name is not 'Date' (default). Leave blank if using station_number argument.
values	Name of column in data that contains numeric flow values, in units of cubic metres per second. Only required if values column name is not 'Value' (default). Leave blank if using station_number argument.
groups	Name of column in data that contains unique identifiers for different data sets, if applicable. Only required if groups column name is not 'STATION_NUMBER'. Function will automatically group by a column named 'STATION_NUMBER' if present. Remove the 'STATION_NUMBER' column beforehand to remove this grouping. Leave blank if using station_number argument.
station_number	Character string vector of seven digit Water Survey of Canada station numbers (e.g. "08NM116") of which to extract daily streamflow data from a HYDAT database. Requires tidyhydat package and a HYDAT database. Leave blank if using data argument.
percentiles	Numeric vector of percentiles to calculate. Set to NA if none required. Default NA.
roll_days	Numeric value of the number of days to apply a rolling mean. Default 1.
roll_align	Character string identifying the direction of the rolling mean from the specified date, either by the first ('left'), last ('right'), or middle ('center') day of the rolling n-day group of observations. Default 'right'.
water_year_start	
	Numeric value indicating the month (1 through 12) of the start of water year for analysis. Default 1.
start_year	Numeric value of the first year to consider for analysis. Leave blank to use the first year of the source data.
end_year	Numeric value of the last year to consider for analysis. Leave blank to use the last year of the source data.
exclude_years	Numeric vector of years to exclude from analysis. Leave blank to include all years.

months   Numeric vector of months to include in analysis (e.g. 6:8 for Jun-Aug). Leave
                  blank to summarize all months (default 1:12).

ignore_missing   Logical value indicating whether dates with missing values should be included
                  in the calculation. If TRUE then a statistic will be calculated regardless of missing
                  dates. If FALSE then only those statistics from time periods with no missing dates
                  will be returned. Default FALSE.

log_discharge   Logical value to indicate plotting the discharge axis (Y-axis) on a logarithmic
                  scale. Default FALSE.

include_title   Logical value to indicate adding the group/station number to the plot, if pro-
                  vided. Default FALSE.

Value

A list of ggplot2 objects for with the following plots (percentile plots optional) for each station
provided:

Annual_Stats   a plot that contains annual statistics

Default plots on each object:

Mean   annual mean of all daily flows

Median   annual median of all daily flows

Maximum   annual maximum of all daily flows

Minimum   annual minimum of all daily flows

See Also

                  include_title = TRUE)

}
```

```
plot_daily_cumulative_stats
```
Plot cumulative daily flow statistics

Description

Plot the daily cumulative mean, median, maximum, minimum, and 5, 25, 75, 95th percentiles for each day of the year from a daily streamflow data set. Calculates statistics from all values from complete, unless specified. Data calculated using calc_daily_cumulative_stats() function. Can plot individual years for comparison using the add_year argument. Defaults to volumetric cumulative flows, can use `use_yield` and `basin_area` to convert to water yield. Returns a list of plots.

Usage

```
plot_daily_cumulative_stats(
  data,
  dates = Date,
  values = Value,
  groups = STATION_NUMBER,
  station_number,
  use_yield = FALSE,
  basin_area,
```

```
  water_year_start = 1,
  start_year,
  end_year,
  exclude_years,
  log_discharge = FALSE,
  include_title = FALSE,
  add_year
)
```

Arguments

data	Data frame of daily data that contains columns of dates, flow values, and (optional) groups (e.g. station numbers). Leave blank if using station_number argument.
dates	Name of column in data that contains dates formatted YYYY-MM-DD. Only required if dates column name is not 'Date' (default). Leave blank if using station_number argument.
values	Name of column in data that contains numeric flow values, in units of cubic metres per second. Only required if values column name is not 'Value' (default). Leave blank if using station_number argument.
groups	Name of column in data that contains unique identifiers for different data sets, if applicable. Only required if groups column name is not 'STATION_NUMBER'. Function will automatically group by a column named 'STATION_NUMBER' if present. Remove the 'STATION_NUMBER' column beforehand to remove this grouping. Leave blank if using station_number argument.
station_number	Character string vector of seven digit Water Survey of Canada station numbers (e.g. "08NM116") of which to extract daily streamflow data from a HYDAT database. Requires tidyhydat package and a HYDAT database. Leave blank if using data argument.
use_yield	Logical value indicating whether to calculate area-based water yield, in mm, instead of volumetric discharge. Default FALSE.
basin_area	Upstream drainage basin area, in square kilometres, to apply to observations. Three options: (1) Leave blank if groups is STATION_NUMBER with HYDAT station numbers to extract basin areas from HYDAT. (2) A single numeric value to apply to all observations. (3) List each basin area for each group/station in groups (can override HYDAT value if listed) as such c("08NM116" = 795,"08NM242" = 10). If group is not listed the HYDAT area will be applied if it exists, otherwise it will be NA.
water_year_start	Numeric value indicating the month (1 through 12) of the start of water year for analysis. Default 1.
start_year	Numeric value of the first year to consider for analysis. Leave blank to use the first year of the source data.
end_year	Numeric value of the last year to consider for analysis. Leave blank to use the last year of the source data.

exclude_years	Numeric vector of years to exclude from analysis. Leave blank to include all years.
log_discharge	Logical value to indicate plotting the discharge axis (Y-axis) on a logarithmic scale. Default `FALSE`.
include_title	Logical value to indicate adding the group/station number to the plot, if provided. Default `FALSE`.
add_year	Numeric value indicating a year of daily flows to add to the daily statistics plot. Leave blank for no years.

Value

A list of ggplot2 objects with the following for each station provided:

`Daily_Cumulative_Stats`
> a plot that contains daily cumulative flow statistics

Default plots on each object:

Mean	daily cumulative mean
Median	daily cumulative median
`Min-5 Percentile Range`	
	a ribbon showing the range of data between the daily cumulative minimum and 5th percentile
`5-25 Percentiles Range`	
	a ribbon showing the range of data between the daily cumulative 5th and 25th percentiles
`25-75 Percentiles Range`	
	a ribbon showing the range of data between the daily cumulative 25th and 75th percentiles
`75-95 Percentiles Range`	
	a ribbon showing the range of data between the daily cumulative 75th and 95th percentiles
`95 Percentile-Max Range`	
	a ribbon showing the range of data between the daily cumulative 95th percentile and the maximum
`'Year' Flows`	(optional) the daily cumulative flows for the designated year

plot_daily_cumulative_stats(station_number = "08NM116")
```

```
# Plot annual daily yield statistics with default HYDAT basin area
plot_daily_cumulative_stats(station_number = "08NM116",
                            use_yield = TRUE)

# Plot annual daily yield statistics with custom basin area
plot_daily_cumulative_stats(station_number = "08NM116",
                            use_yield = TRUE,
                            basin_area = 800)

}
```

---

plot_daily_stats   *Plot daily summary statistics*

Description

Plots means, medians, maximums, minimums, and percentiles for each day of the year of flow values from a daily streamflow data set. Can determine statistics of rolling mean days (e.g. 7-day flows) using the roll_days argument. Calculates statistics from all values, unless specified. The Maximum-Minimum band can be removed using the include_extremes argument and the percentile bands can be customized using the inner_percentiles and outer_percentiles arguments. Data calculated using calc_daily_stats() function. Returns a list of plots.

Usage

```
plot_daily_stats(
  data,
  dates = Date,
  values = Value,
  groups = STATION_NUMBER,
  station_number,
  roll_days = 1,
  roll_align = "right",
  water_year_start = 1,
  start_year,
  end_year,
  exclude_years,
  complete_years = FALSE,
  months = 1:12,
  ignore_missing = FALSE,
  include_extremes = TRUE,
  inner_percentiles = c(25, 75),
  outer_percentiles = c(5, 95),
  add_year,
  log_discharge = TRUE,
  include_title = FALSE
)
```

Arguments

data	Data frame of daily data that contains columns of dates, flow values, and (optional) groups (e.g. station numbers). Leave blank if using `station_number` argument.
dates	Name of column in `data` that contains dates formatted YYYY-MM-DD. Only required if dates column name is not 'Date' (default). Leave blank if using `station_number` argument.
values	Name of column in `data` that contains numeric flow values, in units of cubic metres per second. Only required if values column name is not 'Value' (default). Leave blank if using `station_number` argument.
groups	Name of column in `data` that contains unique identifiers for different data sets, if applicable. Only required if groups column name is not 'STATION_NUMBER'. Function will automatically group by a column named 'STATION_NUMBER' if present. Remove the 'STATION_NUMBER' column beforehand to remove this grouping. Leave blank if using `station_number` argument.
station_number	Character string vector of seven digit Water Survey of Canada station numbers (e.g. `"08NM116"`) of which to extract daily streamflow data from a HYDAT database. Requires `tidyhydat` package and a HYDAT database. Leave blank if using `data` argument.
roll_days	Numeric value of the number of days to apply a rolling mean. Default 1.
roll_align	Character string identifying the direction of the rolling mean from the specified date, either by the first (`'left'`), last (`'right'`), or middle (`'center'`) day of the rolling n-day group of observations. Default `'right'`.
water_year_start	
	Numeric value indicating the month (1 through 12) of the start of water year for analysis. Default 1.
start_year	Numeric value of the first year to consider for analysis. Leave blank to use the first year of the source data.
end_year	Numeric value of the last year to consider for analysis. Leave blank to use the last year of the source data.
exclude_years	Numeric vector of years to exclude from analysis. Leave blank to include all years.
complete_years	Logical values indicating whether to include only years with complete data in analysis. Default `FALSE`.
months	Numeric vector of months to include in analysis (e.g. `6:8` for Jun-Aug). Leave blank to summarize all months (default `1:12`).
ignore_missing	Logical value indicating whether dates with missing values should be included in the calculation. If `TRUE` then a statistic will be calculated regardless of missing dates. If `FALSE` then only those statistics from time periods with no missing dates will be returned. Default `FALSE`.
include_extremes	
	Logical value to indicate plotting a ribbon with the range of daily minimum and maximum flows. Default `TRUE`.

inner_percentiles

> Numeric vector of two percentile values indicating the lower and upper limits of the inner percentiles ribbon for plotting. Default `c(25,75)`, set to `NULL` for no inner ribbon.

outer_percentiles

> Numeric vector of two percentile values indicating the lower and upper limits of the outer percentiles ribbon for plotting. Default `c(5,95)`, set to `NULL` for no outer ribbon.

add_year   Numeric value indicating a year of daily flows to add to the daily statistics plot. Leave blank for no years.

log_discharge   Logical value to indicate plotting the discharge axis (Y-axis) on a logarithmic scale. Default `FALSE`.

include_title   Logical value to indicate adding the group/station number to the plot, if provided. Default `FALSE`.

Value

A list of ggplot2 objects with the following for each station provided:

Daily_Stats   a plot that contains daily flow statistics

Default plots on each object:

Mean   daily mean

Median   daily median

25-75 Percentiles

> a ribbon showing the range of data between the daily 25th and 75th percentiles

5-95 Percentiles

> a ribbon showing the range of data between the daily 5th and 95th percentiles

Minimum-Maximum

> a ribbon showing the range of data between the daily minimum and maximums

'Year'   (on annual plots) the daily flows for the designated year

                 start_year = 1981,
                 end_year = 2010,
                 log_discharge = FALSE)

}
```

---

plot_data_screening   *Plot annual summary statistics for data screening*

Description

Plots the mean, median, maximum, minimum, standard deviation of annual flows. Calculates statistics from all values, unless specified. Data calculated using screen_flow_data() function. Returns a list of plots.

Usage

```
plot_data_screening(
  data,
  dates = Date,
  values = Value,
  groups = STATION_NUMBER,
  station_number,
  roll_days = 1,
  roll_align = "right",
  water_year_start = 1,
  months = 1:12,
  start_year,
  end_year,
  include_title = FALSE
)
```

Arguments

`data`	Data frame of daily data that contains columns of dates, flow values, and (optional) groups (e.g. station numbers). Leave blank if using `station_number` argument.
`dates`	Name of column in `data` that contains dates formatted YYYY-MM-DD. Only required if dates column name is not 'Date' (default). Leave blank if using `station_number` argument.
`values`	Name of column in `data` that contains numeric flow values, in units of cubic metres per second. Only required if values column name is not 'Value' (default). Leave blank if using `station_number` argument.
`groups`	Name of column in `data` that contains unique identifiers for different data sets, if applicable. Only required if groups column name is not 'STATION_NUMBER'. Function will automatically group by a column named 'STATION_NUMBER' if present. Remove the 'STATION_NUMBER' column beforehand to remove this grouping. Leave blank if using `station_number` argument.
`station_number`	Character string vector of seven digit Water Survey of Canada station numbers (e.g. "08NM116") of which to extract daily streamflow data from a HYDAT database. Requires `tidyhydat` package and a HYDAT database. Leave blank if using `data` argument.
`roll_days`	Numeric value of the number of days to apply a rolling mean. Default 1.
`roll_align`	Character string identifying the direction of the rolling mean from the specified date, either by the first (`'left'`), last (`'right'`), or middle (`'center'`) day of the rolling n-day group of observations. Default `'right'`.
`water_year_start`	
	Numeric value indicating the month (1 through 12) of the start of water year for analysis. Default 1.
`months`	Numeric vector of months to include in analysis (e.g. `6:8` for Jun-Aug). Leave blank to summarize all months (default `1:12`).
`start_year`	Numeric value of the first year to consider for analysis. Leave blank to use the first year of the source data.
`end_year`	Numeric value of the last year to consider for analysis. Leave blank to use the last year of the source data.
`include_title`	Logical value to indicate adding the group/station number to the plot, if provided. Default `FALSE`.

Value

A list of ggplot2 objects with the following for each station provided:

`Data_Screening` a plot that contains annual summary statistics for screening

Default plots on each object:

`Minimum`	annual minimum of all daily flows for a given year
`Maximum`	annual maximum of all daily flows for a given year
`Mean`	annual mean of all daily flows for a given year
`StandardDeviation`	
	annual 1 standard deviation of all daily flows for a given year

[screen_flow_data](#)

Examples

```
# Run if HYDAT database has been downloaded (using tidyhydat::download_hydat())
if (file.exists(tidyhydat::hy_downloaded_db())) {

# Plot screening statistics using a data frame and data argument with defaults
flow_data <- tidyhydat::hy_daily_flows(station_number = "08NM116")
plot_data_screening(data = flow_data)

# Plot screening statistics using station_number argument with defaults
plot_data_screening(station_number = "08NM116")

# Plot screening statistics for water years starting in October
plot_data_screening(station_number = "08NM116",
                    water_year_start = 10)

# Plot screening statistics for 7-day flows for July-September months only
plot_data_screening(station_number = "08NM116",
                    roll_days = 7,
                    months = 7:9)

}
```

plot_flow_data	*Plot a daily streamflow data set*

Description

Plot the daily mean flow values from a streamflow data set. Plots daily discharge values from all years, unless specified. Can choose specific dates to start and end plotting. Can choose to plot out each year separately. Multiple groups/stations can be plotted if provided with the groups argument. Returns a list of plots.

Usage

```
plot_flow_data(
  data,
  dates = Date,
  values = Value,
  groups = STATION_NUMBER,
  station_number,
  roll_days = 1,
  roll_align = "right",
  water_year_start = 1,
  start_year,
```

```
    end_year,
    exclude_years,
    start_date,
    end_date,
    log_discharge = FALSE,
    plot_by_year = FALSE,
    one_plot = FALSE,
    include_title = FALSE
)
```

Arguments

data	Data frame of daily data that contains columns of dates, flow values, and (optional) groups (e.g. station numbers). Leave blank if using station_number argument.
dates	Name of column in data that contains dates formatted YYYY-MM-DD. Only required if dates column name is not 'Date' (default). Leave blank if using station_number argument.
values	Name of column in data that contains numeric flow values, in units of cubic metres per second. Only required if values column name is not 'Value' (default). Leave blank if using station_number argument.
groups	Name of column in data that contains unique identifiers for different data sets, if applicable. Only required if groups column name is not 'STATION_NUMBER'. Function will automatically group by a column named 'STATION_NUMBER' if present. Remove the 'STATION_NUMBER' column beforehand to remove this grouping. Leave blank if using station_number argument.
station_number	Character string vector of seven digit Water Survey of Canada station numbers (e.g. "08NM116") of which to extract daily streamflow data from a HYDAT database. Requires tidyhydat package and a HYDAT database. Leave blank if using data argument.
roll_days	Numeric value of the number of days to apply a rolling mean. Default 1.
roll_align	Character string identifying the direction of the rolling mean from the specified date, either by the first ('left'), last ('right'), or middle ('center') day of the rolling n-day group of observations. Default 'right'.
water_year_start	
	Numeric value indicating the month (1 through 12) of the start of water year for analysis. Default 1.
start_year	Numeric value of the first year to consider for analysis. Leave blank to use the first year of the source data.
end_year	Numeric value of the last year to consider for analysis. Leave blank to use the last year of the source data.
exclude_years	Numeric vector of years to exclude from analysis. Leave blank to include all years.
start_date	Date (YYYY-MM-DD) of first date to consider for plotting. Leave blank if all years are required.

end_date	Date (YYYY-MM-DD) of last date to consider for plotting. Leave blank if all years are required.
log_discharge	Logical value to indicate plotting the discharge axis (Y-axis) on a logarithmic scale. Default TRUE.
plot_by_year	Logical value to indicate whether to plot each year of data individually. Default FALSE.
one_plot	Logical value to indicate whether to plot all groups/stations on one plot. Default FALSE.
include_title	Logical value to indicate adding the group/station number to the plot, if provided. Default FALSE.

Value

A ggplot2 object of daily flows from flow_data or HYDAT flow data provided

Examples

```
# Run if HYDAT database has been downloaded (using tidyhydat::download_hydat())
if (file.exists(tidyhydat::hy_downloaded_db())) {

# Plot data from a data frame and data argument
flow_data <- tidyhydat::hy_daily_flows(station_number = "08NM116")
plot_flow_data(data = flow_data)

# Plot data directly from HYDAT
plot_flow_data(station_number = "08NM116")

# Plot statistics with custom years
plot_flow_data(station_number = "08NM116",
               start_year = 1981,
               end_year = 2010,
               exclude_years = c(1991,1993:1995))

# Plot data between specific dates
plot_flow_data(station_number = "08NM116",
               start_date = "1990-01-01",
               end_date = "1990-06-01")

# Plot data multiple groups on one plot
plot_flow_data(station_number = c("08NM241", "08NM242"),
               one_plot = TRUE)

}
```

---

plot_flow_duration   *Plot flow duration curves*

Description

Plots flow duration curves of flow data from a daily streamflow data set. Plots the percent time flows are equalled or exceeded. Calculates statistics from all values, unless specified. Data calculated using `calc_longterm_stats()` function then converted for plotting. Returns a list of plots.

Usage

```
plot_flow_duration(
  data,
  dates = Date,
  values = Value,
  groups = STATION_NUMBER,
  station_number,
  roll_days = 1,
  roll_align = "right",
  water_year_start = 1,
  start_year,
  end_year,
  exclude_years,
  complete_years = FALSE,
  custom_months,
  custom_months_label,
  ignore_missing = FALSE,
  months = 1:12,
  include_longterm = TRUE,
  log_discharge = TRUE,
  include_title = FALSE
)
```

Arguments

data	Data frame of daily data that contains columns of dates, flow values, and (optional) groups (e.g. station numbers). Leave blank if using `station_number` argument.
dates	Name of column in `data` that contains dates formatted YYYY-MM-DD. Only required if dates column name is not 'Date' (default). Leave blank if using `station_number` argument.
values	Name of column in `data` that contains numeric flow values, in units of cubic metres per second. Only required if values column name is not 'Value' (default). Leave blank if using `station_number` argument.
groups	Name of column in `data` that contains unique identifiers for different data sets, if applicable. Only required if groups column name is not 'STATION_NUMBER'. Function will automatically group by a column named 'STATION_NUMBER' if present. Remove the 'STATION_NUMBER' column beforehand to remove this grouping. Leave blank if using `station_number` argument.
station_number	Character string vector of seven digit Water Survey of Canada station numbers (e.g. `"08NM116"`) of which to extract daily streamflow data from a HYDAT

	database. Requires `tidyhydat` package and a HYDAT database. Leave blank if using `data` argument.
roll_days	Numeric value of the number of days to apply a rolling mean. Default 1.
roll_align	Character string identifying the direction of the rolling mean from the specified date, either by the first (`'left'`), last (`'right'`), or middle (`'center'`) day of the rolling n-day group of observations. Default `'right'`.
water_year_start	
	Numeric value indicating the month (1 through 12) of the start of water year for analysis. Default 1.
start_year	Numeric value of the first year to consider for analysis. Leave blank to use the first year of the source data.
end_year	Numeric value of the last year to consider for analysis. Leave blank to use the last year of the source data.
exclude_years	Numeric vector of years to exclude from analysis. Leave blank to include all years.
complete_years	Logical values indicating whether to include only years with complete data in analysis. Default `FALSE`.
custom_months	Numeric vector of months to combine to summarize (ex. `6:8` for Jun-Aug). Adds results to the end of table. If wanting months that overlap calendar years (ex. Oct-Mar), choose `water_year_start` that begins before the first month listed. Leave blank for no custom month summary.
custom_months_label	
	Character string to label custom months. For example, if months = `7:9` you may choose `"Summer"` or `"Jul-Sep"`. Default `"Custom-Months"`.
ignore_missing	Logical value indicating whether dates with missing values should be included in the calculation. If `TRUE` then a statistic will be calculated regardless of missing dates. If `FALSE` then only those statistics from time periods with no missing dates will be returned. Default `FALSE`.
months	Numeric vector of month curves to plot. `NA` if no months required. Default `1:12`.
include_longterm	
	Logical value indicating whether to include long-term curve of all data. Default `TRUE`.
log_discharge	Logical value to indicate plotting the discharge axis (Y-axis) on a logarithmic scale. Default `FALSE`.
include_title	Logical value to indicate adding the group/station number to the plot, if provided. Default `FALSE`.

Value

A list of ggplot2 objects with the following for each station provided:

Flow_Duration	a plot that contains flow duration curves for each month, long-term, and (option) customized months

plot_longterm_daily_stats

Plot long-term summary statistics from daily mean flows

Description

Plots the long-term mean, median, maximum, minimum, and percentiles of daily flow values for over all months and all data (Long-term) from a daily streamflow data set. Calculates statistics from all values, unless specified. The Maximum-Minimum band can be removed using the include_extremes argument and the percentile bands can be customized using the inner_percentiles and outer_percentiles arguments. Data calculated using the calc_longterm_daily_stats() function. Returns a list of plots.

Usage

```
plot_longterm_daily_stats(
  data,
  dates = Date,
  values = Value,
  groups = STATION_NUMBER,
  station_number,
```

```
        roll_days = 1,
        roll_align = "right",
        water_year_start = 1,
        start_year,
        end_year,
        exclude_years,
        complete_years = FALSE,
        ignore_missing = FALSE,
        include_extremes = TRUE,
        inner_percentiles = c(25, 75),
        outer_percentiles = c(5, 95),
        add_year,
        log_discharge = TRUE,
        include_title = FALSE
)
```

Arguments

data	Data frame of daily data that contains columns of dates, flow values, and (optional) groups (e.g. station numbers). Leave blank if using `station_number` argument.
dates	Name of column in `data` that contains dates formatted YYYY-MM-DD. Only required if dates column name is not 'Date' (default). Leave blank if using `station_number` argument.
values	Name of column in `data` that contains numeric flow values, in units of cubic metres per second. Only required if values column name is not 'Value' (default). Leave blank if using `station_number` argument.
groups	Name of column in `data` that contains unique identifiers for different data sets, if applicable. Only required if groups column name is not 'STATION_NUMBER'. Function will automatically group by a column named 'STATION_NUMBER' if present. Remove the 'STATION_NUMBER' column beforehand to remove this grouping. Leave blank if using `station_number` argument.
station_number	Character string vector of seven digit Water Survey of Canada station numbers (e.g. `"08NM116"`) of which to extract daily streamflow data from a HYDAT database. Requires `tidyhydat` package and a HYDAT database. Leave blank if using `data` argument.
roll_days	Numeric value of the number of days to apply a rolling mean. Default 1.
roll_align	Character string identifying the direction of the rolling mean from the specified date, either by the first (`'left'`), last (`'right'`), or middle (`'center'`) day of the rolling n-day group of observations. Default `'right'`.
water_year_start	
	Numeric value indicating the month (1 through 12) of the start of water year for analysis. Default 1.
start_year	Numeric value of the first year to consider for analysis. Leave blank to use the first year of the source data.
end_year	Numeric value of the last year to consider for analysis. Leave blank to use the last year of the source data.

exclude_years	Numeric vector of years to exclude from analysis. Leave blank to include all years.
complete_years	Logical values indicating whether to include only years with complete data in analysis. Default `FALSE`.
ignore_missing	Logical value indicating whether dates with missing values should be included in the calculation. If `TRUE` then a statistic will be calculated regardless of missing dates. If `FALSE` then only those statistics from time periods with no missing dates will be returned. Default `FALSE`.
include_extremes	
	Logical value to indicate plotting a ribbon with the range of daily minimum and maximum flows. Default `TRUE`.
inner_percentiles	
	Numeric vector of two percentile values indicating the lower and upper limits of the inner percentiles ribbon for plotting. Default `c(25,75)`, set to `NULL` for no inner ribbon.
outer_percentiles	
	Numeric vector of two percentile values indicating the lower and upper limits of the outer percentiles ribbon for plotting. Default `c(5,95)`, set to `NULL` for no outer ribbon.
add_year	Numeric value indicating a year of daily flows to add to the daily statistics plot. Leave blank for no years.
log_discharge	Logical value to indicate plotting the discharge axis (Y-axis) on a logarithmic scale. Default `FALSE`.
include_title	Logical value to indicate adding the group/station number to the plot, if provided. Default `FALSE`.

Value

A list of ggplot2 objects with the following for each station provided:

`Long-term_Monthly_Statistics`
            a plot that contains long-term flow statistics

Default plots on each object:

`Monthly Mean`	mean of all annual monthly means for a given month over all years
`Monthly Median`	median of all annual monthly means for a given month over all years
`25-75 Percentiles Range`	
	a ribbon showing the range of data between the monthly 25th and 75th percentiles
`5-95 Percentiles Range`	
	a ribbon showing the range of data between the monthly 5th and 95th percentiles
`Max-Min Range`	a ribbon showing the range of data between the monthly minimum and maximums

}
```

plot_longterm_monthly_stats
                         Plot long-term summary statistics from annual monthly mean flows

Description

Plots the long-term mean, median, maximum, minimum, and percentiles of annual monthly mean flow values for all months and all data (Long-term) from a daily streamflow data set. Calculates statistics from all values, unless specified. The Maximum-Minimum band can be removed using the `include_extremes` argument and the percentile bands can be customized using the `inner_percentiles` and `outer_percentiles` arguments. Data calculated using the `calc_longterm_monthly_stats()` function. Returns a list of plots.

Usage

```
plot_longterm_monthly_stats(
  data,
  dates = Date,
  values = Value,
  groups = STATION_NUMBER,
  station_number,
  roll_days = 1,
  roll_align = "right",
  water_year_start = 1,
  start_year,
  end_year,
  exclude_years,
  complete_years = FALSE,
  ignore_missing = FALSE,
  include_extremes = TRUE,
  inner_percentiles = c(25, 75),
```

```
    outer_percentiles = c(5, 95),
    add_year,
    log_discharge = TRUE,
    include_title = FALSE
)
```

Arguments

`data`	Data frame of daily data that contains columns of dates, flow values, and (optional) groups (e.g. station numbers). Leave blank if using `station_number` argument.
`dates`	Name of column in `data` that contains dates formatted YYYY-MM-DD. Only required if dates column name is not 'Date' (default). Leave blank if using `station_number` argument.
`values`	Name of column in `data` that contains numeric flow values, in units of cubic metres per second. Only required if values column name is not 'Value' (default). Leave blank if using `station_number` argument.
`groups`	Name of column in `data` that contains unique identifiers for different data sets, if applicable. Only required if groups column name is not 'STATION_NUMBER'. Function will automatically group by a column named 'STATION_NUMBER' if present. Remove the 'STATION_NUMBER' column beforehand to remove this grouping. Leave blank if using `station_number` argument.
`station_number`	Character string vector of seven digit Water Survey of Canada station numbers (e.g. `"08NM116"`) of which to extract daily streamflow data from a HYDAT database. Requires `tidyhydat` package and a HYDAT database. Leave blank if using `data` argument.
`roll_days`	Numeric value of the number of days to apply a rolling mean. Default 1.
`roll_align`	Character string identifying the direction of the rolling mean from the specified date, either by the first (`'left'`), last (`'right'`), or middle (`'center'`) day of the rolling n-day group of observations. Default `'right'`.
`water_year_start`	Numeric value indicating the month (1 through 12) of the start of water year for analysis. Default 1.
`start_year`	Numeric value of the first year to consider for analysis. Leave blank to use the first year of the source data.
`end_year`	Numeric value of the last year to consider for analysis. Leave blank to use the last year of the source data.
`exclude_years`	Numeric vector of years to exclude from analysis. Leave blank to include all years.
`complete_years`	Logical values indicating whether to include only years with complete data in analysis. Default `FALSE`.
`ignore_missing`	Logical value indicating whether dates with missing values should be included in the calculation. If `TRUE` then a statistic will be calculated regardless of missing dates. If `FALSE` then only those statistics from time periods with no missing dates will be returned. Default `FALSE`.

include_extremes

> Logical value to indicate plotting a ribbon with the range of daily minimum and maximum flows. Default TRUE.

inner_percentiles

> Numeric vector of two percentile values indicating the lower and upper limits of the inner percentiles ribbon for plotting. Default c(25,75), set to NULL for no inner ribbon.

outer_percentiles

> Numeric vector of two percentile values indicating the lower and upper limits of the outer percentiles ribbon for plotting. Default c(5,95), set to NULL for no outer ribbon.

add_year   Numeric value indicating a year of daily flows to add to the daily statistics plot. Leave blank for no years.

log_discharge   Logical value to indicate plotting the discharge axis (Y-axis) on a logarithmic scale. Default FALSE.

include_title   Logical value to indicate adding the group/station number to the plot, if provided. Default FALSE.

Value

A list of ggplot2 objects with the following for each station provided:

Long-term_Monthly_Statistics

> a plot that contains long-term flow statistics

Default plots on each object:

Monthly Mean   mean of all annual monthly means for a given month over all years

Monthly Median median of all annual monthly means for a given month over all years

25-75 Percentiles Range

> a ribbon showing the range of data between the monthly 25th and 75th percentiles

5-95 Percentiles Range

> a ribbon showing the range of data between the monthly 5th and 95th percentiles

Max-Min Range   a ribbon showing the range of data between the monthly minimum and maximums

}
```

---

plot_missing_dates   *Plot annual and monthly missing dates*

Description

Plots the number of missing data for each month of each year. Calculates statistics from all values, unless specified. Data calculated using `screen_flow_data()` function. Returns a list of plots.

Usage

```
plot_missing_dates(
  data,
  dates = Date,
  values = Value,
  groups = STATION_NUMBER,
  station_number,
  roll_days = 1,
  roll_align = "right",
  water_year_start = 1,
  start_year,
  end_year,
  months = 1:12,
  include_title = FALSE
)
```

Arguments

data   Data frame of daily data that contains columns of dates, flow values, and (op-
                tional) groups (e.g. station numbers). Leave blank if using `station_number`
                argument.

dates   Name of column in `data` that contains dates formatted YYYY-MM-DD. Only
                required if dates column name is not 'Date' (default). Leave blank if using
                `station_number` argument.

values	Name of column in data that contains numeric flow values, in units of cubic metres per second. Only required if values column name is not 'Value' (default). Leave blank if using station_number argument.
groups	Name of column in data that contains unique identifiers for different data sets, if applicable. Only required if groups column name is not 'STATION_NUMBER'. Function will automatically group by a column named 'STATION_NUMBER' if present. Remove the 'STATION_NUMBER' column beforehand to remove this grouping. Leave blank if using station_number argument.
station_number	Character string vector of seven digit Water Survey of Canada station numbers (e.g. "08NM116") of which to extract daily streamflow data from a HYDAT database. Requires tidyhydat package and a HYDAT database. Leave blank if using data argument.
roll_days	Numeric value of the number of days to apply a rolling mean. Default 1.
roll_align	Character string identifying the direction of the rolling mean from the specified date, either by the first ('left'), last ('right'), or middle ('center') day of the rolling n-day group of observations. Default 'right'.
water_year_start	Numeric value indicating the month (1 through 12) of the start of water year for analysis. Default 1.
start_year	Numeric value of the first year to consider for analysis. Leave blank to use the first year of the source data.
end_year	Numeric value of the last year to consider for analysis. Leave blank to use the last year of the source data.
months	Numeric vector of months to include in analysis (e.g. 6:8 for Jun-Aug). Leave blank to summarize all months (default 1:12).
include_title	Logical value to indicate adding the group/station number to the plot, if provided. Default FALSE.

Value

A list of ggplot2 objects with the following for each station provided:

Missing_Dates   a plot that contains the number of missing dates for each year and month

See Also

screen_flow_data

Examples

```
# Run if HYDAT database has been downloaded (using tidyhydat::download_hydat())
if (file.exists(tidyhydat::hy_downloaded_db())) {

# Plot missing dates using a data frame and data argument with defaults
flow_data <- tidyhydat::hy_daily_flows(station_number = "08NM116")
plot_missing_dates(data = flow_data)
```

```
# Plot missing dates using station_number argument with defaults
plot_missing_dates(station_number = "08NM116")

# Plot missing dates for water years starting in October
plot_missing_dates(station_number = "08NM116",
                   water_year_start = 9)

# Plot missing dates for 7-day flows for July-September months only
plot_missing_dates(station_number = "08NM116",
                   roll_days = 7,
                   months = 7:9)

}
```

---

plot_monthly_cumulative_stats

Plot cumulative monthly flow statistics

Description

Plot the monthly cumulative mean, median, maximum, minimum, and 5, 25, 75, 95th percentiles for each month of the year from a daily streamflow data set. Calculates statistics from all values from complete years, unless specified. Data calculated using calc_monthly_cumulative_stats() function. Can plot individual years for comparison using the add_year argument. Defaults to volumetric cumulative flows, can use use_yield and basin_area to convert to water yield. Returns a list of plots.

Usage

```
plot_monthly_cumulative_stats(
  data,
  dates = Date,
  values = Value,
  groups = STATION_NUMBER,
  station_number,
  use_yield = FALSE,
  basin_area,
  water_year_start = 1,
  start_year,
  end_year,
  exclude_years,
  log_discharge = FALSE,
  include_title = FALSE,
  add_year
)
```

Arguments

data	Data frame of daily data that contains columns of dates, flow values, and (optional) groups (e.g. station numbers). Leave blank if using station_number argument.
dates	Name of column in data that contains dates formatted YYYY-MM-DD. Only required if dates column name is not 'Date' (default). Leave blank if using station_number argument.
values	Name of column in data that contains numeric flow values, in units of cubic metres per second. Only required if values column name is not 'Value' (default). Leave blank if using station_number argument.
groups	Name of column in data that contains unique identifiers for different data sets, if applicable. Only required if groups column name is not 'STATION_NUMBER'. Function will automatically group by a column named 'STATION_NUMBER' if present. Remove the 'STATION_NUMBER' column beforehand to remove this grouping. Leave blank if using station_number argument.
station_number	Character string vector of seven digit Water Survey of Canada station numbers (e.g. "08NM116") of which to extract daily streamflow data from a HYDAT database. Requires tidyhydat package and a HYDAT database. Leave blank if using data argument.
use_yield	Logical value indicating whether to calculate area-based water yield, in mm, instead of volumetric discharge. Default FALSE.
basin_area	Upstream drainage basin area, in square kilometres, to apply to observations. Three options: (1) Leave blank if groups is STATION_NUMBER with HYDAT station numbers to extract basin areas from HYDAT. (2) A single numeric value to apply to all observations. (3) List each basin area for each group/station in groups (can override HYDAT value if listed) as such c("08NM116" = 795,"08NM242" = 10). If group is not listed the HYDAT area will be applied if it exists, otherwise it will be NA.
water_year_start	Numeric value indicating the month (1 through 12) of the start of water year for analysis. Default 1.
start_year	Numeric value of the first year to consider for analysis. Leave blank to use the first year of the source data.
end_year	Numeric value of the last year to consider for analysis. Leave blank to use the last year of the source data.
exclude_years	Numeric vector of years to exclude from analysis. Leave blank to include all years.
log_discharge	Logical value to indicate plotting the discharge axis (Y-axis) on a logarithmic scale. Default FALSE.
include_title	Logical value to indicate adding the group/station number to the plot, if provided. Default FALSE.
add_year	Numeric value indicating a year of daily flows to add to the daily statistics plot. Leave blank for no years.

Value

A list of ggplot2 objects with the following for each station provided:

Monthly_Cumulative_Stats
a plot that contains monthly cumulative flow statistics

Default plots on each object:

Mean	monthly cumulative mean
Median	monthly cumulative median

Min-5 Percentile Range
a ribbon showing the range of data between the monthly cumulative minimum and 5th percentile

5-25 Percentiles Range
a ribbon showing the range of data between the monthly cumulative 5th and 25th percentiles

25-75 Percentiles Range
a ribbon showing the range of data between the monthly cumulative 25th and 75th percentiles

75-95 Percentiles Range
a ribbon showing the range of data between the monthly cumulative 75th and 95th percentiles

95 Percentile-Max Range
a ribbon showing the range of data between the monthly cumulative 95th percentile and the maximum

'Year' Flows   (optional) the monthly cumulative flows for the designated year

See Also

calc_monthly_cumulative_stats

Examples

```
# Run if HYDAT database has been downloaded (using tidyhydat::download_hydat())
if (file.exists(tidyhydat::hy_downloaded_db())) {

# Plot annual cumulative volume statistics
plot_monthly_cumulative_stats(station_number = "08NM116")

# Plot annual cumulative yield statistics with default HYDAT basin area
plot_monthly_cumulative_stats(station_number = "08NM116",
                              use_yield = TRUE)

# Plot annual cumulative yield statistics with custom basin area
plot_monthly_cumulative_stats(station_number = "08NM116",
                              use_yield = TRUE,
                              basin_area = 800)

}
```

plot_monthly_stats   *Plot monthly summary statistics*

Description

Plots means, medians, maximums, minimums, and percentiles for each month of all years of flow values from a daily streamflow data set. Calculates statistics from all values, unless specified. Data calculated using the calc_monthly_stats() function. Produces a list containing a plot for each statistic. Returns a list of plots.

Usage

```
plot_monthly_stats(
  data,
  dates = Date,
  values = Value,
  groups = STATION_NUMBER,
  station_number,
  percentiles,
  roll_days = 1,
  roll_align = "right",
  water_year_start = 1,
  start_year,
  end_year,
  exclude_years,
  months = 1:12,
  ignore_missing = FALSE,
  log_discharge = FALSE,
  include_title = FALSE
)
```

Arguments

data	Data frame of daily data that contains columns of dates, flow values, and (optional) groups (e.g. station numbers). Leave blank if using station_number argument.
dates	Name of column in data that contains dates formatted YYYY-MM-DD. Only required if dates column name is not 'Date' (default). Leave blank if using station_number argument.
values	Name of column in data that contains numeric flow values, in units of cubic metres per second. Only required if values column name is not 'Value' (default). Leave blank if using station_number argument.
groups	Name of column in data that contains unique identifiers for different data sets, if applicable. Only required if groups column name is not 'STATION_NUMBER'. Function will automatically group by a column named 'STATION_NUMBER' if present. Remove the 'STATION_NUMBER' column beforehand to remove this grouping. Leave blank if using station_number argument.

station_number   Character string vector of seven digit Water Survey of Canada station numbers
                  (e.g. "08NM116") of which to extract daily streamflow data from a HYDAT
                  database. Requires tidyhydat package and a HYDAT database. Leave blank if
                  using data argument.

percentiles   Numeric vector of percentiles to calculate. Set to NA if none required. Default
                  NA.

roll_days   Numeric value of the number of days to apply a rolling mean. Default 1.

roll_align   Character string identifying the direction of the rolling mean from the specified
                  date, either by the first ('left'), last ('right'), or middle ('center') day of
                  the rolling n-day group of observations. Default 'right'.

water_year_start

                  Numeric value indicating the month (1 through 12) of the start of water year for
                  analysis. Default 1.

start_year   Numeric value of the first year to consider for analysis. Leave blank to use the
                  first year of the source data.

end_year   Numeric value of the last year to consider for analysis. Leave blank to use the
                  last year of the source data.

exclude_years   Numeric vector of years to exclude from analysis. Leave blank to include all
                  years.

months   Numeric vector of months to include in analysis (e.g. 6:8 for Jun-Aug). Leave
                  blank to summarize all months (default 1:12).

ignore_missing   Logical value indicating whether dates with missing values should be included
                  in the calculation. If TRUE then a statistic will be calculated regardless of missing
                  dates. If FALSE then only those statistics from time periods with no missing dates
                  will be returned. Default FALSE.

log_discharge   Logical value to indicate plotting the discharge axis (Y-axis) on a logarithmic
                  scale. Default FALSE.

include_title   Logical value to indicate adding the group/station number to the plot, if pro-
                  vided. Default FALSE.

Value

A list of ggplot2 objects for each monthly statistic for each station provided that contain:

Monthly Mean Flows

                  mean of all daily flows for a given month and year

Monthly Median Flows

                  median of all daily flows for a given month and year

Monthly Maximum Flows

                  maximum of all daily flows for a given month and year

Monthly Minimum Flows

                  minimum of all daily flows for a given month and year

Monthly P'n' Flows

                  (optional) each n-th percentile selected for a given month and year

See Also

calc_monthly_stats

Examples

```
# Run if HYDAT database has been downloaded (using tidyhydat::download_hydat())
if (file.exists(tidyhydat::hy_downloaded_db())) {

# Plot monthly statistics using a data frame and data argument with defaults
flow_data <- tidyhydat::hy_daily_flows(station_number = "08NM116")
results <- plot_monthly_stats(data = flow_data,
                              start_year = 1980,
                              percentiles = 10)

# Plot monthly statistics for water years starting in October
results <- plot_monthly_stats(station_number = "08NM116",
                              start_year = 1980,
                              end_year = 2010,
                              water_year_start = 10,
                              percentiles = 10)

}
```

---

screen_flow_data   *Calculate annual summary and missing data statistics for screening*
                          data

Description

Calculates means, medians, maximums, minimums, standard deviations of annual flows and data availability and missing data statistics for each year and month of each year. Calculates the statistics from all daily discharge values from all years, unless specified. Returns a tibble with statistics.

Usage

```
screen_flow_data(
  data,
  dates = Date,
  values = Value,
  groups = STATION_NUMBER,
  station_number,
  roll_days = 1,
  roll_align = "right",
  water_year_start = 1,
  start_year,
  end_year,
  months = 1:12,
  transpose = FALSE
)
```

Arguments

data	Data frame of daily data that contains columns of dates, flow values, and (optional) groups (e.g. station numbers). Leave blank if using station_number argument.
dates	Name of column in data that contains dates formatted YYYY-MM-DD. Only required if dates column name is not 'Date' (default). Leave blank if using station_number argument.
values	Name of column in data that contains numeric flow values, in units of cubic metres per second. Only required if values column name is not 'Value' (default). Leave blank if using station_number argument.
groups	Name of column in data that contains unique identifiers for different data sets, if applicable. Only required if groups column name is not 'STATION_NUMBER'. Function will automatically group by a column named 'STATION_NUMBER' if present. Remove the 'STATION_NUMBER' column beforehand to remove this grouping. Leave blank if using station_number argument.
station_number	Character string vector of seven digit Water Survey of Canada station numbers (e.g. "08NM116") of which to extract daily streamflow data from a HYDAT database. Requires tidyhydat package and a HYDAT database. Leave blank if using data argument.
roll_days	Numeric value of the number of days to apply a rolling mean. Default 1.
roll_align	Character string identifying the direction of the rolling mean from the specified date, either by the first ('left'), last ('right'), or middle ('center') day of the rolling n-day group of observations. Default 'right'.
water_year_start	Numeric value indicating the month (1 through 12) of the start of water year for analysis. Default 1.
start_year	Numeric value of the first year to consider for analysis. Leave blank to use the first year of the source data.
end_year	Numeric value of the last year to consider for analysis. Leave blank to use the last year of the source data.
months	Numeric vector of months to include in analysis (e.g. 6:8 for Jun-Aug). Leave blank to summarize all months (default 1:12).
transpose	Logical value indicating whether to transpose rows and columns of results. Default FALSE.

Value

A tibble data frame with the following columns:

Year	calendar or water year selected
n_days	number of days per year
n_Q	number of days per year with flow data
n_missing_Q	number of days per year with no flow data
Minimum	annual minimum of all daily flows for a given year

Maximum	annual maximum of all daily flows for a given year
Mean	annual mean of all daily flows for a given year
Median	annual median of all daily flows for a given year
StandardDeviation	
	annual 1 standard deviation of all daily flows for a given year

and the following monthly missing columns (order will depend on water_year_month):

Jan_missing_Q	number of Jan days per year with no flow data
Feb_missing_Q	number of Feb days per year with no flow data
Mar_missing_Q	number of Mar days per year with no flow data
Apr_missing_Q	number of Apr days per year with no flow data
May_missing_Q	number of May days per year with no flow data
Jun_missing_Q	number of Jun days per year with no flow data
Jul_missing_Q	number of Jul days per year with no flow data
Aug_missing_Q	number of Aug days per year with no flow data
Sep_missing_Q	number of Sep days per year with no flow data
Oct_missing_Q	number of Oct days per year with no flow data
Nov_missing_Q	number of Nov days per year with no flow data
Dec_missing_Q	number of Dec days per year with no flow data

Transposing data creates a column of "Statistics" and subsequent columns for each year selected.

Examples

```
# Run if HYDAT database has been downloaded (using tidyhydat::download_hydat())
if (file.exists(tidyhydat::hy_downloaded_db())) {

# Calculate screening statistics usinga data frame and data argument with defaults
flow_data <- tidyhydat::hy_daily_flows(station_number = "08NM116")
screen_flow_data(data = flow_data)

# Calculate screening statistics using station_number argument with defaults
screen_flow_data(station_number = "08NM116")

# Calculate screening statistics for water years starting in October
screen_flow_data(station_number = "08NM116",
                 water_year_start = 9)

# Calculate screening statistics for 7-day flows for July-September months only
screen_flow_data(station_number = "08NM116",
                 roll_days = 7,
                 months = 7:9)

}
```

---

write_flow_data   *Write a streamflow dataset as a .xlsx, .xls, or .csv file*

Description

Write a daily streamflow data set to a directory. Can fill missing dates or filter data by years or
dates before writing using given arguments. List data frame or HYDAT station number to write its
entirety. Can write as .xls, .xlsx, or .csv file types. Writing as Excel file type uses the writexl
package.

Usage

```
write_flow_data(
  data,
  dates = Date,
  values = Value,
  groups = STATION_NUMBER,
  station_number,
  water_year_start = 1,
  start_year,
  end_year,
  start_date,
  end_date,
  file_name,
  fill_missing = FALSE,
  digits
)
```

Arguments

data	Data frame of daily data that contains columns of dates, flow values, and (optional) groups (e.g. station numbers). Leave blank if using station_number argument.
dates	Name of column in data that contains dates formatted YYYY-MM-DD. Only required if dates column name is not 'Date' (default). Leave blank if using station_number argument.
values	Name of column in data that contains numeric flow values, in units of cubic metres per second. Only required if values column name is not 'Value' (default). Leave blank if using station_number argument.
groups	Name of column in data that contains unique identifiers for different data sets, if applicable. Only required if groups column name is not 'STATION_NUMBER'. Function will automatically group by a column named 'STATION_NUMBER' if present. Remove the 'STATION_NUMBER' column beforehand to remove this grouping. Leave blank if using station_number argument.

station_number Character string vector of seven digit Water Survey of Canada station numbers (e.g. "08NM116") of which to extract daily streamflow data from a HYDAT database. Requires `tidyhydat` package and a HYDAT database. Leave blank if using data argument.

water_year_start

Numeric value indicating the month (1 through 12) of the start of water year for analysis. Default 1.

start_year Numeric value of the first year of data to write. Leave blank to use the first year of the source data.

end_year Numeric value of the last year of data to write. Leave blank to use the last year of the source data.

start_date Date (YYYY-MM-DD) of first date of data to write. Leave blank if all dates required.

end_date Date (YYYY-MM-DD) of last date of data to write. Leave blank if all dates required.

file_name Character string naming the output file. If none provided, a default file name (with .xlsx) is provided (see "Successfully created" message when using function for file name).

fill_missing Logical value indicating whether to fill dates with missing flow data with NA. Default `FALSE`.

digits Integer indicating the number of decimal places or significant digits used to round flow values. Use follows that of base::round() digits argument.

Examples

```
## Not run:

# Working examples:

# Write data from a data frame
flow_data <- tidyhydat::hy_daily_flows(station_number = "08NM116")
write_flow_data(data = flow_data,
                file_name = "Mission_Creek_daily_flows.xlsx")

# Write data directly from HYDAT
write_flow_data(station_number = "08NM116",
                file_name = "Mission_Creek_daily_flows.xlsx")

# Write data directly from HYDAT and fill missing dates with NA
write_flow_data(station_number = "08NM116",
                file_name = "Mission_Creek_daily_flows.xlsx",
                fill_missing = TRUE)

## End(Not run)
```

---

write_full_analysis   *Write a suite of tables and plots from various fasstr functions into a*
                             directory

Description

Calculates and writes tables and plots from a suite of statistics from fasstr functions into an Excel
workbook, and accompanying plot files for certain analyses. Due to the number of tables and
plots to be made, this function may take several minutes to complete. If ignore_missing = FALSE
(default) and there is missing data, some tables and plots may be empty and produce warnings.
Use ignore_missing = TRUE to ignore the missing values or filter your data to complete years.
Calculates statistics from all values, unless specified. Returns a list of tibbles and plots, along with
saving the Excel and image files in a directory.

Usage

```
write_full_analysis(
  data,
  dates = Date,
  values = Value,
  groups = STATION_NUMBER,
  station_number,
  analyses = 1:7,
  basin_area,
  water_year_start = 1,
  start_year,
  end_year,
  exclude_years,
  ignore_missing = FALSE,
  zyp_method = "yuepilon",
  zyp_alpha,
  file_name,
  plot_filetype = "pdf"
)
```

Arguments

data	Data frame of daily data that contains columns of dates, flow values, and (optional) groups (e.g. station numbers). Leave blank if using station_number argument.
dates	Name of column in data that contains dates formatted YYYY-MM-DD. Only required if dates column name is not 'Date' (default). Leave blank if using station_number argument.
values	Name of column in data that contains numeric flow values, in units of cubic metres per second. Only required if values column name is not 'Value' (default). Leave blank if using station_number argument.

groups   Name of column in `data` that contains unique identifiers for different data sets, if applicable. Only required if groups column name is not 'STATION_NUMBER'. Function will automatically group by a column named 'STATION_NUMBER' if present. Remove the 'STATION_NUMBER' column beforehand to remove this grouping. Leave blank if using `station_number` argument.

station_number Character string vector of seven digit Water Survey of Canada station numbers (e.g. `"08NM116"`) of which to extract daily streamflow data from a HYDAT database. Requires `tidyhydat` package and a HYDAT database. Leave blank if using `data` argument.

analyses   Numeric vector of analyses to run (default is all (1:7)):

- 1: Screening
- 2: Long-term
- 3: Annual
- 4: Monthly
- 5: Daily
- 6: Annual Trends
- 7: Low-flow Frequencies

basin_area   Upstream drainage basin area, in square kilometres, to apply to observations. Three options:

(1) Leave blank if `groups` is STATION_NUMBER with HYDAT station numbers to extract basin areas from HYDAT.

(2) A single numeric value to apply to all observations.

(3) List each basin area for each group/station in groups (can override HYDAT value if listed) as such `c("08NM116" = 795,"08NM242" = 10)`. If group is not listed the HYDAT area will be applied if it exists, otherwise it will be `NA`.

water_year_start

               Numeric value indicating the month (1 through 12) of the start of water year for analysis. Default 1.

start_year   Numeric value of the first year to consider for analysis. Leave blank to use the first year of the source data.

end_year   Numeric value of the last year to consider for analysis. Leave blank to use the last year of the source data.

exclude_years   Numeric vector of years to exclude from analysis. Leave blank to include all years.

ignore_missing Logical value indicating whether dates with missing values should be included in the calculation. If `TRUE` then a statistic will be calculated regardless of missing dates. If `FALSE` then only those statistics from time periods with no missing dates will be returned. Default `FALSE`.

zyp_method   Character string identifying the prewhitened trend method to use from `'zyp'`, either `'zhang'` or `'yuepilon'`. Only required if analysis group 6 is included. Default `'yuepilon'`.

zyp_alpha   Numeric value of the significance level (ex. `0.05`) of when to plot a trend line. Leave blank for no line.

file_name	Character string of the name of the Excel Workbook (and folder for plots if necessary) to create on drive to write all results.
plot_filetype	Image type to write. One of `'png'`, `'eps'`, `'ps'`, `'tex'`, `'pdf'`, `'jpeg'`, `'tiff'`, `'bmp'`, or `'svg'`. If not `'pdf'` then individual plots will be created instead of a combined PDF. Default `'pdf'`.

```

---

write_objects_list   *Write all data frames and plots from a list of objects into a directory*

Description

Write a list of tables (data frames) and plots (ggplots; as used by `fasstr`) into a directory. Objects that are not class "data.frame" or "gg" will not be saved. Each table and plot will be named by the object name in the list.

Usage

```
write_objects_list(
  list,
  folder_name,
  table_filetype,
  plot_filetype,
  width,
  height,
  units = "in",
  dpi = 300
)
```

Arguments

`list`	List of data frames and plots to write to disk.
`folder_name`	Name of folder to create on disk (if it does not exist) to write each plot from list. If using `combined_pdf` argument, then it will be the name of the PDF document.
`table_filetype`	Table file type to write. One of `'csv'`, `'xls'`, or `'xslx'`.
`plot_filetype`	Image type to write. One of `'png'`, `'eps'`, `'ps'`, `'tex'`, `'pdf'`, `'jpeg'`, `'tiff'`, `'bmp'`, or `'svg'`. Image type will be overwritten if using `combined_pdf` is used.
`width`	Numeric plot width in `units`. If not supplied, uses the size of current graphics device.
`height`	Numeric plot height in `units`. If not supplied, uses the size of current graphics device.
`units`	Character string plot height and width units, one of `'in'`, `'cm'`, or `'mm'`. Default `'in'`.
`dpi`	Numeric resolution of plots. Default `300`.

Examples

```
## Not run:

# Working examples:

# Example list of tables and plots to save
frequency <- compute_annual_frequencies(station_number = "08NM116")

# Write objects in a folder
write_objects_list(list = frequency,
                   folder_name = "Frequency Analysis",
                   table_filetype = "xlsx",
                   plot_filetype = "png")

## End(Not run)
```

---

write_plots   *Write plots from a list into a directory or PDF document*

Description

Write a list of plots (ggplots; as used by `fasstr`) into a directory or PDF document. When writing into a named directory each plot will be named by the plot name listed in the list; uses `ggplot2::ggsave` function. When writing into a PDF document (`combined_pdf == TRUE`) the plot names will not appear; uses `grDevices::pdf` function.

Usage

```
write_plots(
  plots,
  folder_name,
  plot_filetype,
  width,
  height,
  units = "in",
  dpi = 300,
  combined_pdf = FALSE
)
```

Arguments

`plots`	List of plots to write to disk.
`folder_name`	Name of folder to create on disk (if it does not exist) to write each plot from list. If using `combined_pdf` argument, then it will be the name of the PDF document.
`plot_filetype`	Image type to write. One of `'png'`, `'eps'`, `'ps'`, `'tex'`, `'pdf'`, `'jpeg'`, `'tiff'`, `'bmp'`, or `'svg'`. Image type will be overwritten if using `combined_pdf` is used.
`width`	Numeric plot width in `units`. If not supplied, uses the size of current graphics device.
`height`	Numeric plot height in `units`. If not supplied, uses the size of current graphics device.
`units`	Character string plot height and width units, one of `'in'`, `'cm'`, or `'mm'`. Default `'in'`.
`dpi`	Numeric resolution of plots. Default `300`.
`combined_pdf`	Logical value indicating whether to combine list of plots into one PDF document. Default `FALSE`.

Examples

```
## Not run:

# Working examples:

# Example plots to save
plots <- plot_annual_lowflows(station_number = "08NM116")

# Write the plots as "png" files
write_plots(plots = plots,
            folder_name = "Low Flow Plots",
            plot_filetype = "png")

# Write the plots as a combined "pdf" document
write_plots(plots = plots,
            folder_name = "Low Flow Plots",
            combined_pdf = TRUE)

## End(Not run)
```

---

write_results	*Write a data frame as a .xlsx, .xls, or .csv file*

Description

Write a data frame to a directory with all numbers rounded to specified digits. Can write as .xls, .xlsx, or .csv file types. Writing as .xlsx or .xls uses the writexl package.

Usage

```
write_results(data, file_name, digits)
```

Arguments

data	Data frame to be written to a directory.
file_name	Character string naming the output file. Required.
digits	Integer indicating the number of decimal places or significant digits used to round flow values. Use follows that of base::round() digits argument.

Examples

```
## Not run:

# Working examples:

# Example data to write
data_results <- calc_longterm_daily_stats(station_number = c("08HA002", "08HA011"),
```

```
                                              start_year = 1971, end_year = 2000)

# Write the data and round numbers to 1 decimal place
write_results(data = data_results,
              file_name = "Cowichan River Long-term Flows (1971-2000).xlsx",
              digits = 1)

## End(Not run)
```
