

# Package ‘jmvcore’

November 17, 2022

**Type** Package

**Title** Dependencies for the 'jamovi' Framework

**Version** 2.3.19

**Date** 2022-11-16

**Author** Jonathon Love

**Maintainer** Jonathon Love <jon@thon.cc>

**Description** A framework for creating rich interactive analyses for the jamovi platform (see <<https://www.jamovi.org>> for more information).

**URL** <https://www.jamovi.org>

**BugReports** <https://github.com/jamovi/jmvcore/issues>

**License** GPL (>= 2)

**ByteCompile** yes

**Depends** R (>= 3.2)

**Imports** R6 (>= 1.0.1), rlang (>= 0.3.0.1), jsonlite, base64enc, stringi

**Suggests** testthat (>= 1.0.2), RProtoBuf, knitr, ggplot2, RColorBrewer, ragg, fastmap

**RoxygenNote** 6.1.1

**NeedsCompilation** no

**Repository** CRAN

**Date/Publication** 2022-11-17 18:50:02 UTC

## R topics documented:

Analysis . . . . .	2
canBeNumeric . . . . .	3
Cell.BEGIN_GROUP . . . . .	3
colorPalette . . . . .	4

---

Analysis	<i>the jmvcore Object classes</i>
----------	-----------------------------------

---

## Description

the jmvcore Object classes

## Usage

Analysis

Array

Column

Group

Html

Image

Output

Preformatted

State

Table

**Format**

An object of class R6ClassGenerator of length 25.

---

canBeNumeric	<i>Determines whether an object is or can be converted to numeric</i>
--------------	---

---

**Description**

Determines whether an object is or can be converted to numeric

**Usage**

canBeNumeric(object)

**Arguments**

object            the object

---

Cell.BEGIN_GROUP	<i>Constants to specify formatting of Table cells</i>
------------------	---

---

**Description**

Cell.BEGIN\_GROUP adds spacing above a cell

**Usage**

Cell.BEGIN\_GROUP

Cell.END\_GROUP

Cell.BEGIN\_END\_GROUP

Cell.NEGATIVE

Cell.INDENTED

**Format**

An object of class `numeric` of length 1.

**Details**

`Cell.END_GROUP` add spacing below a cell

`Cell.BEGIN_END_GROUP` add spacing above and below a cell

`Cell.NEGATIVE` specifies that the cells contents is negative

**Examples**

```
## Not run:  
  
table$addFormat(rowNo=1, col=1, Cell.BEGIN_END_GROUP)  
  
## End(Not run)
```

---

colorPalette

*A function that creates a color palette*

---

**Description**

A function that creates a color palette

**Usage**

```
colorPalette(n = 5, pal = "jmv", type = "fill")
```

**Arguments**

n	Number of colors needed
pal	Color palette name
type	'fill' or 'color'

**Value**

a vector of hex color codes

---

composeFormula	<i>Compose a formula string</i>
----------------	---------------------------------

---

**Description**

Compose a formula string

**Usage**

```
composeFormula(lht, rht)
```

**Arguments**

lht	list of character vectors making up the left
rht	list of character vectors making up the right

**Value**

a string representation of the formula

**Examples**

```
composeFormula(list('a', 'b', c('a', 'b')))  
# ~a+b+a:b  
  
composeFormula('f', list('a', 'b', c('a', 'b')))  
# "f~a+b+a:b"  
  
composeFormula('with spaces', list('a', 'b', c('a', 'b')))  
'`with spaces`~a+b+a:b'
```

---

composeTerm	<i>Compose and decompose interaction terms to and from their components</i>
-------------	---

---

**Description**

Compose and decompose interaction terms to and from their components

**Usage**

```
composeTerm(components)

composeTerms(listOfComponents)

decomposeTerm(term)

decomposeTerms(terms)
```

**Arguments**

components	a character vectors of components
listOfComponents	a list of character vectors of components
term	a string with components separated with colons
terms	a character vector of components separated with colons

**Examples**

```
composeTerm(c('a', 'b', 'c'))
# 'a:b:c'

composeTerm(c('a', 'b', 'with space'))
# 'a:b:`with space`'

decomposeTerm('a:b:c')
# c('a', 'b', 'c')

decomposeTerm('a:b:`with space`')
# c('a', 'b', 'with space')
```

---

constructFormula	<i>Construct a formula string</i>
------------------	-----------------------------------

---

**Description**

Construct a formula string

**Usage**

```
constructFormula(dep = NULL, terms)
```

**Arguments**

dep	the name of the dependent variable
terms	list of character vectors making up the terms

**Value**

a string representation of the formula

**Examples**

```
constructFormula(terms=list('a', 'b', c('a', 'b')))  
# a+b+a:b
```

```
constructFormula('f', list('a', 'b', c('a', 'b')))  
# "f~a+b+a:b"
```

```
constructFormula('with spaces', list('a', 'b', c('a', 'b')))  
'\`with spaces`~a+b+a:b'
```

---

create

*Create an analysis*

---

**Description**

Used internally by jamovi

**Usage**

```
create(ns, name, optionsPB, datasetId, analysisId, revision)
```

**Arguments**

ns	package name
name	analysis name
optionsPB	options protobuf object
datasetId	dataset id
analysisId	analysis id
revision	revision

---

createError	<i>Create and throw errors</i>
-------------	--------------------------------

---

**Description**

These functions are convenience functions for creating and throwing errors.

**Usage**

```
createError(formats, code = NULL, ...)
```

```
reject(formats, code = NULL, ...)
```

**Arguments**

formats	a format string which is passed to <a href="#">format</a>
code	an error code
...	additional arguments passed to <a href="#">format</a>

---

decomposeFormula	<i>Decompose a formula</i>
------------------	----------------------------

---

**Description**

Decompose a formula

**Usage**

```
decomposeFormula(formula)
```

**Arguments**

formula	the formula to decompose
---------	--------------------------

**Value**

a list of lists of the formulas components

---

extractErrorMessage     *Extracts the error message from an error object*

---

**Description**

Extracts the error message from an error object

**Usage**

```
extractErrorMessage(error)
```

**Arguments**

error             an error object

---

format             *Format a string with arguments*

---

**Description**

Substitutes the arguments into the argument str. See the examples below.

**Usage**

```
format(str, ..., context = "normal")
```

**Arguments**

str                the format string  
...                the arguments to substitute into the string  
context            'normal' or 'R'

**Value**

the resultant string

**Examples**

```
jmvcore::format('the {} was delish', 'fish')  
# 'the fish was delish'  
  
jmvcore::format('the {} was more delish than the {}', 'fish', 'cow')  
# 'the fish was more delish than the cow'
```

```
jmvcore::format('the {1} was more delish than the {0}', 'fish', 'cow')  
# 'the cow was more delish than the fish'  
  
jmvcore::format('the {what} and the {which}', which='fish', what='cow')  
# 'the cow and the fish'  
  
jmvcore::format('that is simply not {}', TRUE)  
# 'that is simply not true'  
  
jmvcore::format('that is simply not {}', TRUE, context='R')  
# 'that is simply not TRUE'
```

---

isError	<i>Determine if an object is an error</i>
---------	---

---

**Description**

Determine if an object is an error

**Usage**

```
isError(object)
```

**Arguments**

object            the object to test

**Value**

TRUE if the object is an error

---

marshalData	<i>Marshal the data from an environment into a data frame</i>
-------------	---

---

**Description**

Marshal the data from an environment into a data frame

**Usage**

```
marshalData(env, ...)
```

**Arguments**

env            the environment to marshal from  
 ...            the variables to marshal

**Value**

a data frame

marshalFormula            *Marshal a formula into options*

**Description**

Marshal a formula into options

**Usage**

```
marshalFormula(formula, data, from = "rhs", type = "vars",
  permitted = c("numeric", "factor"), subset = ":", required = FALSE)
```

**Arguments**

formula        the formula  
 data           a data frame to marshal the data from  
 from          'rhs' or 'lhs', which side of the formula should be marshalled  
 type          'vars' or 'terms', the type of the option be marshalled to  
 permitted     the types of data the option permits  
 subset        a subset of the formula to marshal  
 required      whether this marshall is required or not

matchSet            *Determines the index where an item appears*

**Description**

Determines the index where an item appears

**Usage**

```
matchSet(x, table)
```

**Arguments**

x                    the item to find  
 table                the object to search

**Value**

the index of where the item appears, or -1 if it isn't present

---

naOmit                    *remove missing values from a data frame listwise*

---

**Description**

removes all rows from the data frame which contain missing values (NA)

**Usage**

naOmit(object)

**Arguments**

object                the object to remove missing values from

**Details**

this function is equivalent to `na.omit` from the stats package, however it preserves attributes on columns in data frames

---

Options                    *The jmv Options classes*

---

**Description**

The jmv Options classes

**Usage**

Options  
 OptionBool  
 OptionList  
 OptionNMXList

OptionVariables  
OptionTerm  
OptionVariable  
OptionOutput  
OptionTerms  
OptionInteger  
OptionNumber  
OptionString  
OptionLevel  
OptionGroup  
OptionPair  
OptionSort  
OptionArray  
OptionPairs

**Format**

An object of class R6ClassGenerator of length 25.

---

resolveQuo	<i>Evaluates a quosure This is intended for use by classes overriding Analysis</i>
------------	--

---

**Description**

Evaluates a quosure This is intended for use by classes overriding Analysis

**Usage**

```
resolveQuo(quo)
```

**Arguments**

quo            the quosure to evaluate

**Value**

the value of the quosure

---

select	<i>Create a new data frame with only the selected columns</i>
--------	---

---

**Description**

Shorthand equivalent to `subset(df, select=columnNames)`, however it additionally preserves attributes on the columns

**Usage**

```
select(df, columnNames)
```

**Arguments**

df	the data frame
columnNames	the names of the columns to make up the new data frame

**Value**

the new data frame

---

sourcify	<i>Converts basic R object into their source representation</i>
----------	---

---

**Description**

Converts basic R object into their source representation

**Usage**

```
sourcify(object, indent = "")
```

**Arguments**

object	the object to convert to source
indent	the level of indentation to use

**Value**

a string of the equivalent source code

**Examples**

```
sourcify(NULL)

# 'NULL'

sourcify(c(1,2,3))

# 'c(1,2,3)''

l <- list(a=7)
l[['b']] <- 3
l[['c']] <- list(d=3, e=4)
sourcify(l)

# 'list(
#   a=7,
#   b=3,
#   c=list(
#     d=3,
#     e=4))'
```

---

**startsWith***Test whether strings start or end with a particular string*

---

**Description**

Same as `base::startsWith()` and `base::endsWith()` except available for `R < 3.3`

**Usage**

```
startsWith(x, prefix)
```

```
endsWith(x, suffix)
```

**Arguments**

<code>x</code>	a string to test
<code>prefix</code>	a string to test the presence of
<code>suffix</code>	a string to test the presence of

---

stringifyTerm	<i>Converts a term into a string</i>
---------------	--------------------------------------

---

### Description

Converts a term (a vector of components) into a string for display purposes

### Usage

```
stringifyTerm(components, sep = getOption("jmvTermSep", ":"),  
              raise = FALSE)
```

### Arguments

components	a character vector of components
sep	a separator to go between the components
raise	whether duplicates should be raised to powers

### Value

the components joined together into a string for display

### Examples

```
stringifyTerm(c('a', 'b', 'c'))  
  
# "a:b:c"  
  
stringifyTerm(c('a', 'b', 'c'), sep=' * ')  
  
# "a * b * c"  
  
options('jmvTermSep', ' * ')  
stringifyTerm(c('a', 'b', 'c'))  
  
# "a * b * c"  
  
#' stringifyTerm(c('\`quoted\`', 'b', 'c'))  
  
# "quoted * b * c"
```

---

theme_default	<i>Creates the default jmv ggplot2 theme</i>
---------------	--

---

**Description**

Creates the default jmv ggplot2 theme

**Usage**

```
theme_default(base_size = 16, scale = "none", palette = "jmv")
```

**Arguments**

base_size	Font size
scale	'none' or 'discrete'
palette	Color palette name

**Value**

the default jmv ggplot2 theme

---

theme_hadley	<i>Creates the hadley jmv ggplot2 theme</i>
--------------	---

---

**Description**

Creates the hadley jmv ggplot2 theme

**Usage**

```
theme_hadley(base_size = 16, scale = "none", palette = "jmv")
```

**Arguments**

base_size	Font size
scale	'none' or 'discrete'
palette	Color palette name

**Value**

the hadley jmv ggplot2 theme

---

theme_min	<i>Creates the minimal jmv ggplot2 theme</i>
-----------	--

---

**Description**

Creates the minimal jmv ggplot2 theme

**Usage**

```
theme_min(base_size = 16, scale = "none", palette = "jmv")
```

**Arguments**

base_size	Font size
scale	'none' or 'discrete'
palette	Color palette name

**Value**

the minimal jmv ggplot2 theme

---

theme_spss	<i>Creates the spss jmv ggplot2 theme</i>
------------	---

---

**Description**

Creates the spss jmv ggplot2 theme

**Usage**

```
theme_spss(base_size = 16, scale = "none", palette = "jmv")
```

**Arguments**

base_size	Font size
scale	'none' or 'discrete'
palette	Color palette name

**Value**

the spss jmv ggplot2 theme

---

toB64	<i>Convert names to and from Base64 encoding</i>
-------	--

---

**Description**

Note: uses the . and \_ characters rather than + and / allowing these to be used as variable names

**Usage**

```
toB64(names)
```

```
fromB64(names)
```

**Arguments**

names	the names to be converted base64
-------	----------------------------------

---

toNumeric	<i>Converts a vector of values to numeric</i>
-----------	---

---

**Description**

Similar to [as.numeric](#), however if the object has a values attribute attached, these are used as the numeric values

**Usage**

```
toNumeric(object)
```

**Arguments**

object	the vector to convert
--------	-----------------------

---

tryNaN	<i>try an expression, and return NaN on failure</i>
--------	---

---

**Description**

if the expression fails, NaN is returned silently

**Usage**

```
tryNaN(expr)
```

**Arguments**

expr            an expression to evaluate

**Value**

the result, or NaN on failure
